
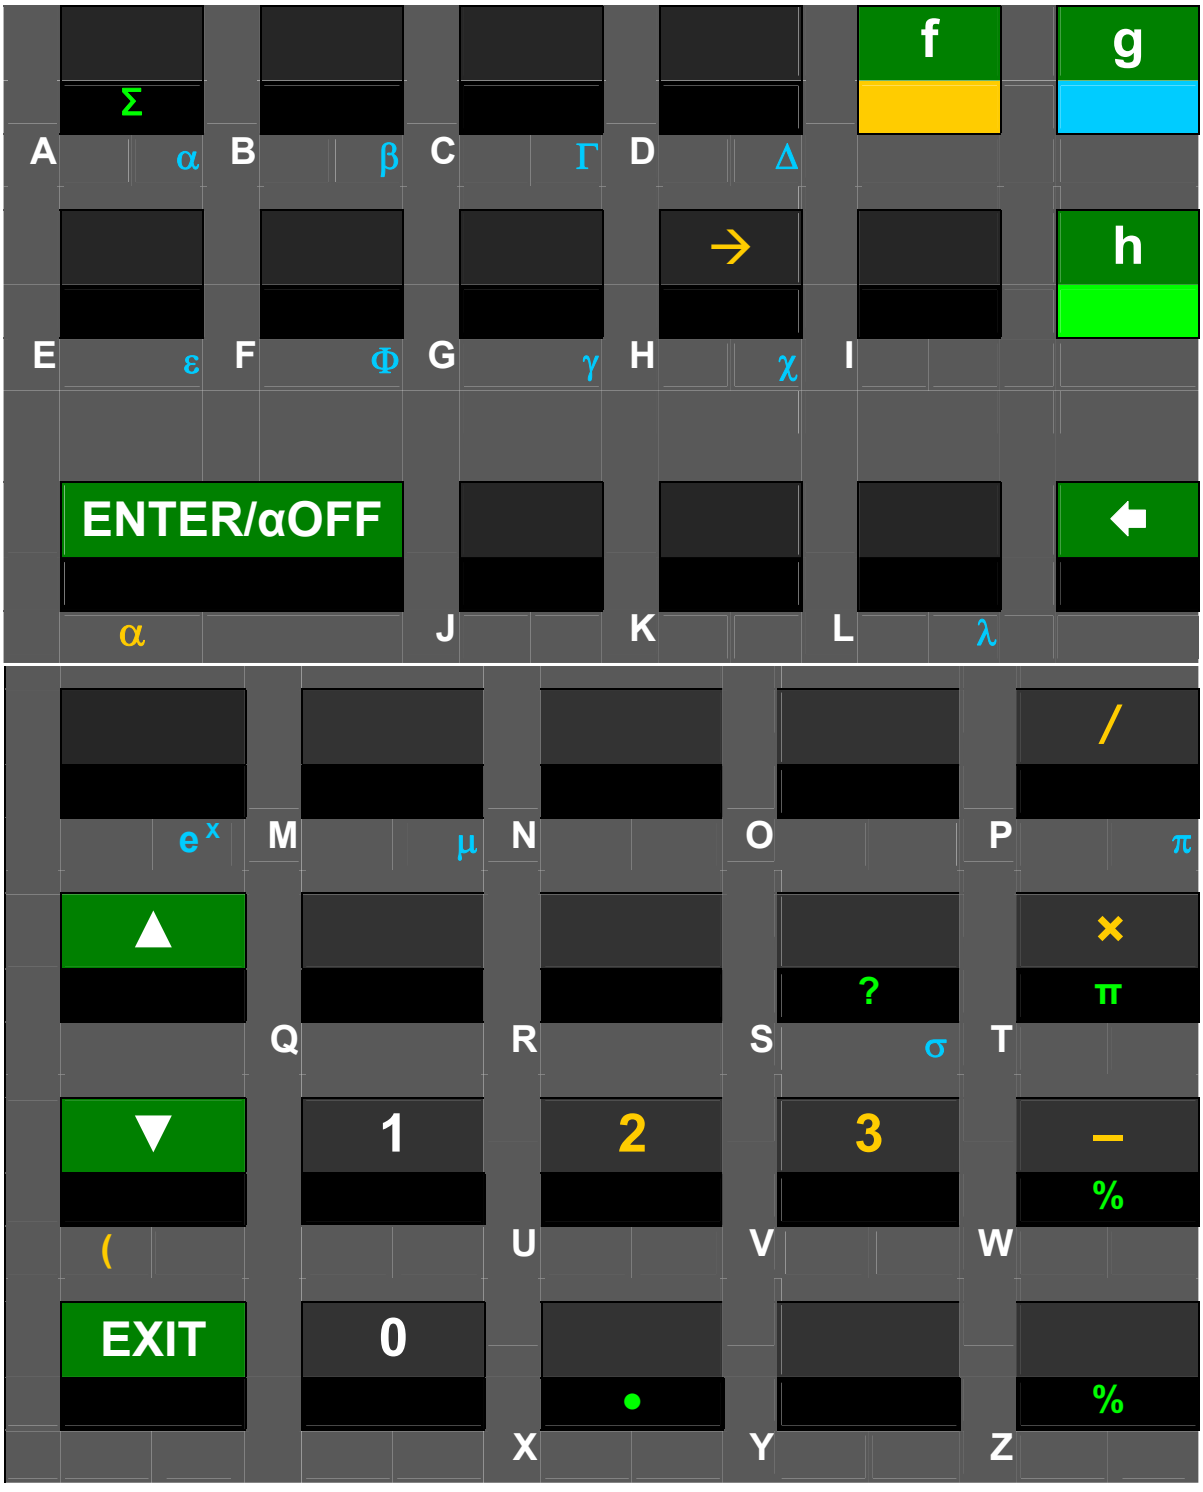
Keyboard layout:

- CPX may be combined with +, -, x, /, ±, x^2, √x, 1/x, //, !, Γ, π, IxI, RND, as well as e.g. (HYP) SIN, COS, TAN, logs and their inverses. See the index for more.
- Modes are as described in the paragraph about indicators below.
- → is combined with H, H.MS, DEG, RAD, GRAD, 2, 8, 10, 16 for conversions.
- The keys B, C, and D immediately call the respective user programs if existent.

Active virtual keyboard in hexadecimal mode. [→] is for addressing and temporary display in another base only (see below). The primary functions of the top left 6 keys are numeric input, so their default primary functions are accessed using f-shift. – In the other integer modes, the active keyboard will look alike, but the keys not needed for numeric input in the respective base will keep their default primary functions (except Σ+).

Active virtual keyboard in alpha mode. Therein, the 15 bytes alpha register is displayed in the dot matrix section and all input is appended directly to this register – the numeric line is accessible by commands only. Primary function of most keys will be inserting the letter printed bottom left of such a key, dark red on the original keyboard. For these keys, f-shift is necessary to reach the function on key top, and g-shift leads to homonymic Greek characters, where applicable. There are three exceptions, **ψ** being accessed via g-shifted **0** (below PSE), **τ** via g-shifted minus (one key below **T**), and **η** via f-shifted **E**. Generally, ⬆ toggles upper and lower case. PSE will insert a space. Only labels printed on green or red background in this picture execute the respective function.



Active virtual keyboard in temporary alpha mode. This mode is called when opening catalogues and during some addressing. The functions printed on green background allow for catalogue browsing, error recovery, and leaving. See regular alpha mode, the addressing tables, and the catalogues for more.

MEMORY

Stack

L	**I**

T
Z
Y
X

Display

In complex arithmetic, stack registers **X** and **Y** contain the real and imaginary part of the first complex number, while **Z** and **T** carry the second. Stack register **I** takes the imaginary part of the last argument if a complex function is used. See LASTx.
As long as no complex function is used, **I** may be taken as another general purpose register.

General purpose registers 87 through 99 take the statistical sums indicated as soon as [Σ+] is used.

Flag D is set if “NaN” and “infinite” are allowed as result of commands.

ADDRESSING REGISTERS

1	User input	x= ? or any of the other comparisons				RCL, STO, aRCL, aSTO, VIEW, x≷, DSE, ISG, DSZ, ISZ, FIX, SCI, ENG, DISP, BASE, CF and the other flag commands, CB and many more bit commands		
	Display	OP _ (e.g. x > _) Temporary alpha mode is on.				OP _ (e.g. RCL _) Alpha mode is off.		
2	User input [1]	0 or 1	X, Y, Z, T, L, or I	ENTER↑ closes alpha.	→ closes alpha.	X, Y, Z, T, L, or I [2]	*Number of register or flag or bit(s) or decimals* [3]	→
	Display	OP *n* e.g. x ≤ 0	OP *x* e.g. x ≥ y	OP r_	OP →_	OP s *x* e.g. STO ≤Z	OP *nn* e.g. SF 15	OP →_ (indirect addressing)
3	User input			*Register no.* 0 0 … 9 9	Look right for more about indirect addressing.	Store ***x*** on stack level **Z**.	X, Y, Z, T, L, or I	*Register number* 0 0 … 9 9
	Display			OP r *nn* e.g. x ≠ r23			OP →s *x* e.g. VIEW →≤L	OP → *nn* e.g. SCI →03
				Compare ***x*** with the number in reg. **23**.			Show the content of the register where **LASTx** is pointing to.	Select scientific display with the # of decimals specified in register **03**.

[1] For **RCL** and **STO**, an arithmetic operator (+, –, ×, /) as well as MAX or MIN may precede step 2. See the index of operations. RCL C calls **CONST**.

[2] For **RCL**, **STO**, **VIEW**, and **x<>** only. For **VIEW** and **x<>**, you may address these registers directly without switching to alpha mode before. For **RCL** and **STO**, only the stack registers **X, Y, L** and **I** may be addressed directly this way. Some stack operations may be useless but allowed, e.g. **x<>sX** . It is the user's responsibility not to mix pairs in complex mode, since a complex operation will always affect two registers: the one specified and the adjacent register.

[3] Register and flag numbers may be 0 0 … 9 9 , number of decimals up to 1 1 , bases up to 1 6 , bit numbers up to 6 3 , integer word size up to 6 4 . For numbers <10, you may key in e.g. 5 ENTER↑ instead of 0 5 . There are three additional flags addressed via B, C, and D .

ADDRESSING LABELS

1	User input	GTO, XEQ , LBL, SOLVE or INTEG [4]			
	Display	OP _ (e.g. GTO _) Alpha mode is off.			
2	User input	B , C, or D	ENTER↑ turns alpha mode on.	→ [5]	*2-digit numeric label* 0 0 … 9 9
	Display	OP '*name*' e.g. GTO'B'	OP '_	OP →_ (indirect addressing)	OP *nn* e.g. LBL 07
3	User input		*Label* [6] + ENTER↑ Last key closes alpha mode.	Any stack level, i.e. X , Y , Z , T , L, or I [7]	*Register number* 0 0 … 9 9
	Display		OP '*name*' e.g. SLV'STF'	OP →s *x* e.g. INT →sY	OP → *nn* e.g. XEQ →44
			Solve the function **STF** (with STF keyed in).	Integrate the function which's label is on stack level **y**.	Execute the routine which's label is in register **44**.

[4] **SOLVE** and **INTEG** will be displayed and listed as SLV and INT, respectively. The labels B, C, and D may be called directly via the 3 keys top left on the keyboard, no need to press XEQ here.

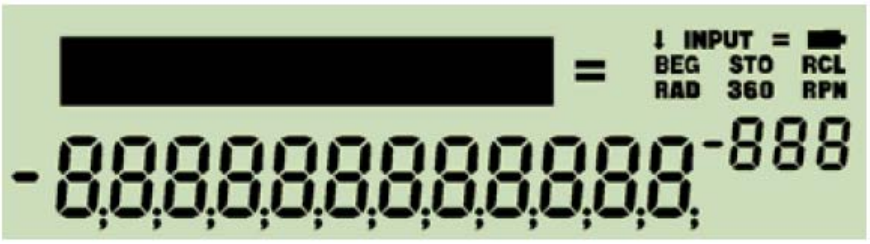
[5] Works with all these operations except **LBL**.

[6] Such a label may consist of up to 3 alphanumeric characters. ENTER↑ is only needed if less than 3 characters are entered.

[7] You may address these registers directly without switching to alpha mode before.

DISPLAY

The display features 3 sections: numeric, dot matrix and fixed symbols. The latter are called annunciators, and are for indicating modes (see the paragraph about indicators below). The dot matrix is 6 dots high and 43 dots wide, allowing for some 7 to 12 characters, depending on their widths. The numeric section features a sign, 12 digits for the mantissa, a sign for the exponent, and 3 digits for the exponent.



In general, the 34S uses the dot matrix for indication of some more modes than the annunciators allow, for showing the alpha register, and for passing additional information to the user.

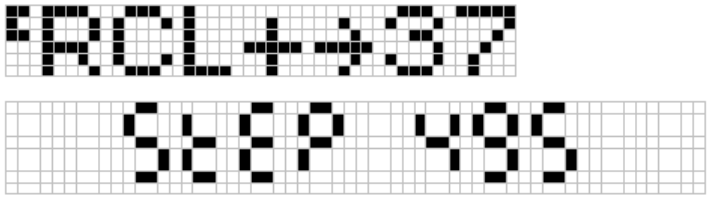
Some commands and modes use the display sections in a special way:

1. STATUS displays the status of the flags in a very compact way, allowing a brief status overlook after some training. For example, if the flags 2, 3, 5, 7, 11, 13, 17, 19, and 23 are set, calling STATUS will display this:

   Within the numeric section, each row of horizontal bars in the mantissa shows the status of 10 flags. When a flag is set, the respective bar turns black. So here the top row indicates flags 0 and 1 are clear, flags 2 and 3 are set, and flag 4 is clear. Then, a divider is inserted to separate the first group of five flags from the next. Thereafter, flag 5 is set, 6 is clear, 7 is set, 8 and 9 are clear. Next row starts with flag 10 being clear, 11 set, 12 clear, 13 set, etc. Scrolling down by ▼ will display the flags 10 – 39, then 20 – 49 etc. until 90 – D. Scrolling up by ▲ reverts this. Alternatively, pressing a digit will show the flags starting with 10 times this digit. The numeric exponent displays the status of the 3 hotkeys top left on the keyboard: if A, b, or C show up, the respective label is defined in program memory.
   The STATUS display will disappear when another key is pressed but ▼ or ▲ or a digit.

2. In integer modes, word size and complement setting are shown in the dot matrix, while the exponent indicates the base setting, carry, and overflow (see next paragraph).

3. In programming mode, the numeric display indicates the program step (001 – 500) in the mantissa and the number of unused steps in the exponent, while the dot matrix shows the command contained in the respective step.



INDICATORS

There are a number of indicators signaling the mode the calculator is running in.

Indicator	*INPUT*	b	d	h	o	*STO*
Mode name if different	α					**PRG**
Set by operation	αON [8]	BASE 2	BASE 10	BASE 16	BASE 8	PRGON
Cleared by operation	αOFF	BASE ≠2 FLOAT FRACT	BASE ≠10 FLOAT FRACT	BASE ≠16 FLOAT FRACT	BASE ≠8 FLOAT FRACT	PRGOFF

Indicator	*360*	G	H.MS	*RAD*	/c
Set by operation	DEG	GRAD	H.MS >H.MS	RAD	BASE 1 FRACT 2nd . in input (\HMS)
Cleared by operation	GRAD RAD	DEG RAD	BASE FLOAT >HR	DEG GRAD	BASE ≠1 FLOAT

INPUT, STO, 360, and *RAD* are annunciators (see previous paragraph). Outside integer modes, everything else is indicated in the text line. A capital **C** shows the last operation executed was a complex one, so you know you have to look at ***x*** and ***y*** then. The different date modes are signaled by **D.MY** or **M.DY**. Defaults Y.MD and FLOAT are not indicated. RPN may be shown permanently.

Within integer modes, word size and complement setting are shown in the dot matrix in a format WW.C, with C being **1** or **2** for 1's or 2's complement, **U** for unsigned, or **S** for sign-and-mantissa mode. In these modes, the exponent is used for further indications: its sign and its first digit show the base, a "**c**" in the second digit signals a carry bit set, an "**o**" in the third an overflow. Integer bases are indicated as follows:

Base	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
Display	b	3	4	5	6	7	o	9	d	-1	-2	-3	-4	-5	h

All inputs are interpreted according to the mode set at input time. – A running program is signaled by a flashing *RCL* annunciator.

[8] Alpha mode may be temporarily entered and left during addressing – see the tables above for more information. Alpha mode will also be entered opening the catalogues X.FCN, P.FCN, STAT, CONST, or CONV to allow for easy finding and selecting the item you are interested in. Keying in a character will jump to the first item starting with it, entering a second one will jump to the first item starting with this sequence, or anything following in the alphabet if this is not found. [ENTER↑] will select the item you are on. After executing it, mode will return to the state it had before calling the catalogue, except the command chosen did change the mode in execution.

INDEX OF OPERATIONS

This lists all functions available on the 34S with the necessary keystrokes. Functions accessible via X.FCN will show up in this catalogue with their names unless specified differently explicitly. Sorting is as follows: 0 … 9, A … Z, α … ω, (,), +, -, *, /, ±, ",", ".", !, ?, ⇔, ←, ↑, ↓, →, <, ≤, =, ≠, ≥, >, #, °, %, √, ∞. Super- and subscripts are handled like normal characters prefixed by ↑ or ↓, respectively. Sorting is case insensitive.

The operations will work like on the HP-42S, special bit and integer functions like on the HP-16C, unless stated otherwise under remarks. Functions available on the 34S for the first time on an RPN calculator are highlighted under remarks, as are functions deviating from known ones carrying the same name. If no parameters are specified though required, they will be taken from the stack. Modes are abbreviated by their indicators. In this column an "&" represents logical AND, and a backslash stands for "all but", so e.g. ABS works in all modes but alpha. General operations with modes printed on red background are not programmable.

Name in listings	Keys to press	Works in modes	Remarks
c…	CPX …	FLOAT	Indicates complex operations [9]. CPX may be combined with any function which's name is printed in *italics* in this table. The three dots will be replaced in the listing by the name of the function attached.
10^x	g 10^x	FLOAT	
12h	h X.FCN 12h	FLOAT	Sets 12h time display.
1COMPL	h X.FCN 1COMPL	Integer	Like 1's complement in HP-16C.
1/x	f 1/x	FLOAT	
	B	FLOAT	As long as this label is not used yet.
24h	h X.FCN 24h	FLOAT	Sets 24h time display.
2COMPL	h X.FCN 2COMPL	Integer	Like 2's complement in HP-16C.
2^x	g 2^x	\α	
ABS	f |x|	\α	
	CPX f |x|	FLOAT	Calculates the magnitude $\sqrt{x^2+y^2}$, returning it in **X** and clearing **Y**.
ACOS	g COS^{-1}	FLOAT, H.MS	

[9] Such operations work with pairs of adjacent registers. In each such pair, the first register contains the real and the second the imaginary part of the respective complex number. Unless stated otherwise explicitly, where a real function works with ***x*** (and maybe ***y***), its complex sibling works with ***x + i y*** (and maybe ***z + i t***). Where a real function works with a register at address ***a***, the respective complex function works with the registers at ***a*** and ***a + 1***.

Name in listings	Keys to press	Works in modes	Remarks
ACOSH	g HYP^{-1} COS	FLOAT	
ALL	h X.FCN ALL	FLOAT	
AND	h AND	Integer	
		FLOAT	Works like AND in HP-28S, i.e. ***x*** and ***y*** are interpreted before executing this operation. Any real number except zero is taken as "true", zero is "false".
ANGLE	h X.FCN ANGLE	FLOAT	Calculates the polar angle of **y** / **x** , i.e. the angle between the straight line connecting the origin with the point (x, y), and the positive x-axis.
ASIN	g SIN^{-1}	FLOAT, H.MS	
ASINH	g HYP^{-1} SIN	FLOAT	
ASR	h X.FCN ASR ***n***	Integer	Works like *n* (1 … 64) consecutive ASRs on HP-16C. See the table above for addressing *n*. In indirect addressing *n* may be zero.
ATAN	g TAN^{-1}	FLOAT, H.MS	
ATANH	g HYP^{-1} TAN	FLOAT	
BASE	h X.FCN BASE ***n***	\α	Sets the base for integer calculations, with $2 \le n \le 16$. Popular bases are directly accessible on the keyboard. Furthermore, BASE 0 calls FLOAT, and BASE 1 calls FRACT. See additional opportunities for *n* in the table above.
BASE 2	f 2		
BASE 8	g 8		
BASE 10	f 10		
BASE 16	g 16		
BC?	h P.FCN BC? ***n***	Integer	Tests the *n*-th bit in ***x***. See opportunities for *n* in the table above.
BESTF	h STAT BESTF	FLOAT	Selects the best curve fit model according to the correlation found like BEST in HP-42S.
BS?	h P.FCN BS? ***n***	Integer	Works in analogy to "BC?".
B#	h X.FCN B#	Integer	Counts bits set like #B on HP-16C.
CB	h X.FCN CB ***n***	Integer	Clears the *n*-th bit in ***x***. See opportunities for *n* in the table above.
CEIL	h X.FCN CEIL	FLOAT	Computes the smallest integer ≥ ***x***.

Name in listings	Keys to press	Works in modes	Remarks
CF	h CF ***n***	\α	See opportunities for *n* in the table above.
CLALL	h X.FCN CLALL	\PRG	Global clear after confirmation.
CLFLAG	h X.FCN CLFLAG	\PRG	Clears all user flags.
CLPR	h CLPR	PRG	Clears current program after confirmation.
		\PRG, \α	Clears active program after confirmation.
CLREG	h X.FCN CLREG	\α	Clears all general purpose registers.
CLSTK	h CLST	\α	
CLx	h CLx	\α	
	←	\α	If no input is pending.
CLα	f CL(α)	All	Clears the alpha register like CLA in HP-42S.
CLΣ	g CLΣ	FLOAT	
COMB	f Cy,x	FLOAT	
CONJ	h CONJ	FLOAT	Changes the sign of ***y***.
CORR	g r	FLOAT	
COS	f COS	FLOAT, H.MS	
COSH	f HYP COS	FLOAT	
DATE	h X.FCN DATE	FLOAT	Recalls the date from the real time clock and displays it in the date format selected. See D.MY, M.DY, and Y.MD. The function DATE in HP-12C corresponds to DAYS+ here (see below).
DAY	h X.FCN DAY	FLOAT	Takes ***x*** as a date and returns the day of week in the dot matrix and a corresponding integer in the numeric display (Sunday = 7).
DAYS+	h X.FCN DAYS+	FLOAT	Adds a number of days in **X** on a date in **Y** and displays the resulting date including the day of week (Sunday = 7). This function works like DATE in HP-12C.
DBLR	h X.FCN DBLR	Integer	Double precision commands like in HP-16C, but now for up to 128 bits.
DBL*	h X.FCN DBL*		
DBL/	h X.FCN DBL/		

Name in listings	Keys to press	Works in modes	Remarks
DEG	g DEG	FLOAT	
DECOMP	h X.FCN DECOMP	/c	Decomposes the fraction in **X** , i.e. puts its numerator in **Y** and its denominator in **X**.
DENANY	h X.FCN DENANY	FLOAT	Default fraction format like in HP-32SII, allowing maximum precision.
DENFAC	h X.FCN DENFAC	FLOAT	"Factors of the maximum denominator" fraction format like in HP-32SII.
DENFIX	h X.FCN DENFIX	FLOAT	Fixed denominator fraction format like in HP-32SII.
DENMAX	h X.FCN DENMAX	FLOAT	Works as **/c** does in HP-32SII, but maximum (and default) denominator is 9999.
DISP	h X.FCN DISP ***n***	FLOAT	Changes the number of decimals while keeping the mode (FIX, SCI, ENG). See opportunities for *n* in the table above.
DROP	h X.FCN DROP	\α	Drops ***x*** , i.e. changes stack contents from [***x, y, z, t***] to [***y, z, t, t***].
DROPY	h X.FCN DROPY	\α	Changes stack contents from [***x, y, z, t***] to [***x, z, t, t***].
DSE	f DSE ***reg***	PRG	See opportunities for *reg* in the table above.
DSZ	h P.FCN DSZ ***reg***		
D.MY	h X.FCN D.MY	FLOAT	Sets the format for date calculations.
D→J	h X.FCN D→J	FLOAT	Assumes ***x*** is a date and converts it to a Julian day number.
D→R	h X.FCN D→R	FLOAT	Assumes **X** containing degrees and converts them to radians. Mode is kept constant.
E3OFF	h X.FCN E3OFF	FLOAT	Toggles the thousands separator (either a comma or a point depending on the radix setting).
E3ON	h X.FCN E3ON		
ENG	f ENG ***n***	FLOAT	See opportunities for *n* in the table above.
ENTER↑	ENTER↑	\α	
ERF	h STAT ERF	FLOAT	Calculates the error function erf(***x***).
EXPF	h STAT EXPF	FLOAT	Selects the exponential curve fit model.
e^x	g e^x	FLOAT	
e^x -1	h X.FCN e^x-1	FLOAT	

Name in listings	Keys to press	Works in modes	Remarks
FB	h X.FCN FB ***n***	Integer	Inverts ("flips") the *n*-th bit in ***x***. See opportunities for *n* in the table above.
FC?	h P.FCN FC? ***n***	\α	See opportunities for *n* in the table above.
FC?C	h P.FCN FC?C ***n***		
FC?F	h P.FCN FC?F ***n***		
FC?S	h P.FCN FC?S ***n***		
FF	h X.FCN FF ***n***	\α	Flips the flag specified. See opportunities for *n* in the table above.
FIB	h X.FCN FIB	\α	Calculates the Fibonacci number F_x .
FILL	h FILL	\α	Copies ***x*** in **Y**, **Z**, and **T**.
FIX	f FIX ***n***	FLOAT	See opportunities for *n* in the table above.
FLOAT	f .d	\α	Works like DECM in HP-42S. Additionally, converts H.MS data in **X** to decimal.
	g H	H.MS	
FLOOR	h X.FCN FLOOR	FLOAT	Computes the largest integer ≤ ***x***.
FP	g FP	FLOAT	
FRACT	g b/c	FLOAT	Sets fraction mode like in HP-32SII. Maximum denominator is 9999. Absolute values must be > 10E-5 and < 10E5.
FS?	h FS? ***n***	\α	See opportunities for *n* in the table above.
FS?C	h P.FCN FS?C ***n***		
FS?F	h P.FCN FS?F ***n***		
FS?S	h P.FCN FS?S ***n***		
F(x)	h STAT F(x)	FLOAT	Like Q(F) in HP-21S. Equals FDIST(***x***; ***r01***; ***r02***) in MS Excel.
$F^{-1}(p)$	h STAT $F^{-1}(p)$	FLOAT	Like Fp in HP-21S. Equals FINV(***x***; ***r01***; ***r02***) in MS Excel.
GCD	h X.FCN GCD	\α	Returns the Greatest Common Divisor of ***x*** and ***y***.
GRAD	g GRAD	FLOAT	

Name in listings	Keys to press	Works in modes	Remarks
GTO	h GTO ***label***	PRG	Like in HP-32S. See opportunities for *label* in the table above.
		\PRG, \α	
	h GTO . ***label***	\PRG, \α	
	h GTO . .		
H.MS	g H.MS	FLOAT	Sets H.MS mode.
H.MS+	+	H.MS	
H.MS–	–		
INT	h INTEG ***label***	FLOAT	Integration parameters will be transferred like in HP-15C. See opportunities for *label* in the table above.
IP	f IP	FLOAT	
ISG	g ISG ***reg***	PRG	See opportunities for *reg* in the table above.
ISZ	h P.FCN ISZ ***reg***		
I β	h X.FCN I β	FLOAT	Calculates the regularized incomplete beta function β(***x***, ***a***, ***b***) with ***a*** taken from **Z** and ***b*** from **Y**.
I Γ	h X.FCN I Γ	FLOAT	Calculates the regularized incomplete gamma function $\gamma(x,y)/\Gamma(x)$.
J→D	h X.FCN J→D	FLOAT	Assumes ***x*** is a Julian day number and converts it to a date.
LASTx	g LASTx	\α	
	CPX g LASTx	FLOAT	Recalls the contents of **L** and **I** into **X** and **Y**.
LBL	f LBL ***label***	PRG	See opportunities for *label* in the table above.
LCM	h X.FCN LCM	\α	Returns the Least Common Multiple of ***x*** and ***y***.
LEAP?	h P.FCN LEAP?	PRG & FLOAT	Takes ***x*** as a date, extracts the year, and checks if it is a leap year.
LINF	h STAT LINF	FLOAT	Selects the linear curve fit model.
LJ	h X.FCN LJ	Integer	
LN	f LN	FLOAT	
LN1+X	h X.FCN LN1+X	FLOAT	

Name in listings	Keys to press	Works in modes	Remarks
LN β	h X.FCN LN β	FLOAT	Calculates the natural logarithm of *β* or Γ, respectively. See these functions.
LN Γ	h X.FCN LN Γ		
LOGF	h STAT LOGF	FLOAT	Selects the logarithmic curve fit model.
LOGy	f LOGy	FLOAT	Calculates the logarithm for base ***y***.
	CPX f LOGy	FLOAT	Calculates the logarithm of the complex number ***x + i y*** for base ***z + i t*** .
LOG$_{10}$	f LG	FLOAT	
LOG$_2$	f LOG2	\α	Calculates the logarithm for base 2.
LR	h L.R.	FLOAT	Calculates the parameters of the fit curve (through the data points accumulated) according to the model selected. Returns A0 in **X** and A1 in **Y**. In the linear model, A0 is the intercept and A1 the slope of the regression line.
MASKL	h X.FCN MASKL ***n***	Integer	Work like MASKL and MASKR on HP-16C, but with the parameter following the command instead of taken from **X**. See opportunities for *n* in the table above.
MASKR	h X.FCN MASKR ***n***		
MAX	h X.FCN MAX	\α	Returns the maximum of ***x*** and ***y***.
MEAN	f $\bar{x}$	FLOAT	
MIN	h X.FCN MIN	\α	Returns the minimum of ***x*** and ***y***.
MIRROR	h X.FCN MIRROR	Integer	Reflects bit patterns (e.g. 000101 → 101000 for word size 6)
MOD	h MOD	\α	
M.DY	h X.FCN M.DY	FLOAT	Sets the format for date calculations.
NAND	h X.FCN NAND	Integer	
		FLOAT	Works in analogy to AND.
NaN?	h P.FCN NaN?	PRG	Asks for “not a number”.
NOP	h P.FCN NOP	PRG	
NOR	h X.FCN NOR	Integer	
		FLOAT	Works in analogy to AND.
NOT	h NOT	Integer	
		FLOAT	Works in analogy to AND.

Name in listings	Keys to press	Works in modes	Remarks
nΣ	h STAT NΣ	FLOAT	Recalls the number of accumulated data points. Necessary for basic statistics.
N(x)	h STAT N(x)	FLOAT	Like NORMDIST(***x***; ***z***; ***y***; 1) in MS Excel.
$N^{-1}(p)$	h STAT $N^{-1}(p)$	FLOAT	Like NORMINV(***x***; ***z***; ***y***) in MS Excel.
OFF	h P.FCN OFF	PRG	
ON	h P.FCN ON	PRG	
OR	h OR	Integer	
		FLOAT	Works in analogy to AND.
PAUSE	h PSE	PRG	
PERM	g Py,x	FLOAT	
PROMPT	h X.FCN PROMPT	PRG	
PWRF	h STAT PWRF	FLOAT	Selects the power curve fit model.
Q(x)	f Q	FLOAT	Like Q in HP-32E and Q(z) in HP-21S. Equals NORMSDIST(***x***; 1) in MS Excel.
$Q^{-1}(p)$	g Q^{-1}	FLOAT	Like Q^{-1} in HP-32E and z_P in HP-21S. Equals NORMSINV(***x***) in MS Excel.
RAD	g RAD	FLOAT	
RAND#	h STAT RAND#	\α	Like RAN in HP-42S.
RCL	RCL ***reg***	\h, \α	See opportunities for *reg* in the table above.
	f RCL ***reg***	h	
RCLWS	h X.FCN RCLWS	Integer	Recalls the word size set. See WSIZ.
RCL+	RCL + ***reg***	\h, \α (needs f in hex mode)	Recalls the content of address *reg* , executes **OP *x*** on it and stores the result in **X**. RCL▲ (▼) takes the maximum (minimum) of the value in *reg* and ***x*** . See opportunities for *reg* in the table above. Complex RCL affects ***x*** and ***y*** as well as two general purpose registers as explained at the top of this table.
RCL–	RCL − ***reg***		
RCL×	RCL × ***reg***		
RCL/	RCL / ***reg***		
RCL▲	RCL ▲ ***reg***		
RCL▼	RCL ▼ ***reg***		
RDX,	h ./,	FLOAT	Toggles the radix mark.
RDX.			

Name in listings	Keys to press	Works in modes	Remarks
RJ	h X.FCN RJ	Integer	Works in analogy to LJ.
RL	h X.FCN RL ***n***	Integer	Works like *n* consecutive RLs / RLCs on HP-16C. For RL, 1 ≤ n ≤ 63. For RLC, 1 ≤ n ≤ 64. See the table above for addressing *n*. In indirect addressing *n* may be zero.
RLC	h X.FCN RLC ***n***		
RNDINT	h X.FCN RNDINT	FLOAT	Rounds ***x*** to next integer. ½ rounds to 1.
ROUND	g RND	FLOAT	Like RND in HP-42S.
		/c	Like RND in HP-32SII.
RR	h X.FCN RR ***n***	Integer	Works like *n* consecutive RRs / RRCs on HP-16C. See RL / RLC for more.
RRC	h X.FCN RRC ***n***		
RTN	g RTN	PRG	
RTN+1	n/a	PRG	Internal support routine.
R/S	R/S	\PRG, \α	
R↑	h R↑	\α	
R↓	R↓		
R→D	h X.FCN R→D	FLOAT	Assumes **X** containing radians and converts them to degrees. Mode is kept constant.
SB	h X.FCN SB ***n***	Integer	Sets the *n*-th bit in ***x***. See opportunities for *n* in the table above.
SCI	f SCI ***n***	FLOAT	See opportunities for *n* in the table above.
SDEV	g s	FLOAT	
SEED	h STAT SEED	FLOAT	
SERR	h STAT SERR	FLOAT	Calculates $\frac{SDEV}{\sqrt{n}}$.
SETDAT	h X.FCN SETDAT	FLOAT, H.MS	Sets the date for the real time clock.
SETTIM	h X.FCN SETTIM		Sets the time for the real time clock.
SF	h SF ***n***	\α	See opportunities for *n* in the table above.
SIGMA	h STAT SIGMA	FLOAT	Calculates $SDEV \cdot \sqrt{\frac{n}{n-1}}$.
	h STAT σ		
SIGN	h X.FCN SIGN	\α	

Name in listings	Keys to press	Works in modes	Remarks
SIGNMT	h X.FCN SIGNMT	Integer	Sets sign-and-mantissa mode for integers.
SIN	f SIN	FLOAT, H.MS	
SINC	h X.FCN SINC	FLOAT	Calculates $\frac{\sin(x)}{x}$.
SINH	f HYP SIN	FLOAT	
SL	h X.FCN SL ***n***	Integer	Works like *n* (1 … 64) consecutive SLs on HP-16C. See the table above for addressing *n*. In indirect addressing *n* may be zero.
SLV	h SOLVE ***label***	FLOAT	See opportunities for *label* in the table above.
SR	h X.FCN SR ***n***	Integer	Works like *n* consecutive SRs on HP-16C. See SL for more.
STO	STO ***reg***	\-5, \h, \α	See opportunities for *reg* in the table above.
	f STO ***reg***	-5, h	
STOP	R/S	PRG	
STO+	STO + ***reg***	\-5, \h, \α (needs f in modes -5 and h)	Calls the content of address *reg* , executes **OP *x*** on it and stores the result into said address. STO▲ (▼) takes the maximum (minimum) of the value in *reg* and ***x*** and stores the result. See opportunities for *reg* in the table above. Complex STO affects ***x*** and ***y*** as well as two general purpose registers as explained at the top of this table.
STO–	STO − ***reg***		
STO×	STO × ***reg***		
STO/	STO / ***reg***		
STO▲	STO ▲ ***reg***		
STO▼	STO ▼ ***reg***		
SUM	RCL Σ+	FLOAT	
TAN	f TAN	FLOAT, H.MS	
TANH	f HYP TAN	FLOAT	
TIME	h X.FCN TIME	FLOAT, H.MS	Recalls the time from the real time clock.
t(x)	h STAT t(x)	FLOAT	Like Q(t) in HP-21S. Equals TDIST(***x***; ***r01***; 1) in MS Excel.
$t^{-1}(p)$	h STAT $t^{-1}(p)$	FLOAT	Like tp in HP-21S. Equals TINV(2****x***; ***r01***) in MS Excel.
UNSIGN	h X.FCN UNSIGN	Integer	

Name in listings	Keys to press	Works in modes	Remarks
VERS	h X.FCN VERS	All	Displays the firmware version.
VIEW	h VIEW ***reg***	All	See opportunities for *reg* in the table above.
W	h X.FCN W	FLOAT	Calculates Lambert's W for given x ≥ -1/e
W^{-1}	h X.FCN W^{-1}	FLOAT	Inverts W, i.e. calculates x for given W (≥ -1).
WMEAN	h STAT WMEAN	FLOAT	Calculates the weighted mean.
WSIZ	h X.FCN WSIZ ***n***	Integer	Works like WSIZE on HP-16C, but with the parameter following the command instead of taken from **X**. WSIZ 0 will set the word size to maximum. See the table above for addressing *n*.
XEQ	XEQ ***label***	PRG	Calls the respective subroutine.
		\PRG, \α	Executes the respective program. See opportunities for *label* in the table above.
	B , C , or D	PRG	Calls the respective subroutine, so e.g. XEQ B will be inserted in the program when B is pressed.
		\PRG, \α	Executes the respective program if defined.
	f B , C , or D	-2, -3, -4, -5, h	
XNOR	h X.FCN XNOR	Integer	
		FLOAT	Works in analogy to AND.
XOR	h XOR	Integer	
		FLOAT	Works in analogy to AND.
x !	h !	FLOAT	
***x*↔**	h x≷ ***reg***	\α	See opportunities for *reg* in the table above.
x*↔*y	x≷y	\α	This performs **Re<>Im** if a complex operation was executed before.
	CPX x≷y	FLOAT	Exchanges ***x*** and ***y*** with ***z*** and ***t***.
x^2	g x^2	\α	
x → α	h X.FCN X→α	All	Works like XTOA in HP-42S.

Name in listings	Keys to press	Works in modes	Remarks
x < … ?	f x < ? ***arg***	\α	Compares ***x*** with *arg*. See opportunities for *arg* in the table above. The three dots will be replaced in the listing by *arg* according to the samples given in said table.
x ≤ … ?	g x ≤ ? ***arg***		
x = … ?	f x = ? ***arg***		
x ≠ … ?	g x ≠ ? ***arg***		
x ≥ … ?	f x ≥ ? ***arg***		
x > … ?	g x > ? ***arg***		
$\hat{x}$	h STAT $\hat{x}$	FLOAT	Predicts a forecast x for a given y according to the curve fit model chosen. See L.R. for more.
Y.MD	h X.FCN Y.MD	FLOAT	Sets the format for date calculations.
y^x	g y^x	FLOAT	
	C	FLOAT	As long as this label is not used yet.
ŷ	f ŷ	FLOAT	Predicts a forecast y for a given x according to the curve fit model chosen. See L.R. for more.
αAPP	h X.FCN αAPP ***char***	\α	Switches to alpha mode for the input of 1 character, appends this to the alpha register, and returns to the mode set before. Eventually, this equals the sequence **αON** *char* **αOFF**.
αDATE	h X.FCN αDATE	FLOAT, α	Takes ***x*** as a date and appends it to the alpha register in the format selected.
αDAY	h X.FCN αDAY	FLOAT, α	Takes ***x*** as a date, recalls the name of the respective day and appends it to the alpha register.
αIP	h X.FCN αIP	All	Like AIP in HP-42S.
αLENG	h X.FCN αLENG	All	Like ALENG in HP-42S.
αMONTH	h X.FCN αMONTH	FLOAT, α	Takes ***x*** as a date, recalls the name of the month and appends it to the alpha register.
αOFF	ENTER↑	α	Toggle alpha mode like AOFF and AON in HP-42S. **Not programmable.**
αON	f α	\α	

Name in listings	Keys to press	Works in modes	Remarks
αRCL	f RCL ***reg***	α	Interprets the contents of *reg* as characters and appends them to the alpha register. See opportunities for *reg* in the table above.
	h X.FCN αRCL ***reg***	\α	
αRC#	h X.FCN αRC# ***reg***	All	As αRCL, but αRC# interprets the contents of *reg* as a number and appends this in current format to the alpha register.
αRL	h X.FCN αRL ***n***	All	αRL works like AROT in HP-42S, but with a positive parameter following the command instead of taken from **X**. αRR rotates to the right instead. αSL shifts the *n* left-most characters out of the alpha register, similar to ASHF in HP-42S. αRR shifts the *n* right-most characters instead. See the table above for addressing *n*. In indirect addressing *n* may be zero.
αRR	h X.FCN αRR ***n***		
αSL	h X.FCN αSL ***n***		
αSR	h X.FCN αSR ***n***		
αSTO	f STO ***reg***	α	See opportunities for *reg* in the table above.
	h X.FCN αSTO ***reg***	\α	
αTIME	h X.FCN αTIME	FLOAT, α	Takes ***x*** as a time HH.MMSS, converts it to a string in the format selected, and appends it to the alpha register.
αVIEW	h X.FCN αVIEW	\α	
α → x	h X.FCN α→X	All	Like ATOX in HP-42S.
β	h X.FCN β	FLOAT	Calculates Euler's Beta function B(***x***, ***y***).
Γ	h STAT Γ	FLOAT	Also contained in X.FCN.
ΔDAYS	h X.FCN ΔDAYS	FLOAT	Calculates the number of days between 2 dates ***x*** and ***y***. Works like in HP-12C.
Δ%	f Δ%	FLOAT	Like %CH in HP-42S.
π	h π	FLOAT	
	CPX h π	FLOAT	Returns π in **X** and clears **Y** for using π in complex calculations.
	D or CPX D	FLOAT	Work as above as long as this label is not used yet.

Name in listings	Keys to press	Works in modes	Remarks
Σlnx	h STAT ΣLNX	FLOAT	Recalls the respective statistical sum. These sums are necessary for the curve fitting models beyond pure linear. See below for more.
Σlnxy	h STAT ΣLNXY		
Σlny	h STAT ΣLNY		
$\Sigma \ln^2 x$	h STAT ΣLN2X		
$\Sigma \ln^2 y$	h STAT ΣLN2Y		
Σxlny	h STAT ΣXLNY		
Σylnx	h STAT ΣYLNX		
Σx	h STAT ΣX	FLOAT	Recalls the respective statistical sum. These sums are necessary for basic statistics and linear curve fitting. Calling them by name enhances readability of programs significantly.
Σxy	h STAT ΣXY		
Σx^2	h STAT ΣX2		
Σy	h STAT ΣY		
Σy^2	h STAT ΣY2		
Σ+	Σ+	FLOAT	
Σ–	h Σ–	FLOAT	
χ^2	h STAT χ^2	FLOAT	Like Q(χ^2) in HP-21S. Equals CHIDIST(***x***; ***r01***) in MS Excel.
χ^2INV	h STAT χ^2INV	FLOAT	Like χ^2_p in HP-21S. Equals CHIINV(***x***; ***r01***) in MS Excel.
+	+	\α	
–	–		
×	×		
/	/		
+/–	+/–		
//	g //	FLOAT	Calculates $\left(\frac{1}{x}+\frac{1}{y}\right)^{-1}$.
→DEG	→ g DEG	FLOAT	Assumes **X** containing angles in actual angular mode and converts them to degrees. Mode is kept constant.
→GRAD	→ g GRAD	FLOAT	Works like →DEG, but converts to gon.

Name in listings	Keys to press	Works in modes	Remarks
→HR	→ f H	H.MS	Takes the hours or degrees in **X** and converts them into decimal numbers.
→H.MS	→ g H.MS	FLOAT	Assumes **X** containing *decimal* hours or degrees and converts them in the format HHH.MMSS.
→POL	g ▶P	FLOAT	Assumes **X** and **Y** containing the coordinates x and y and converts them to r and ϑ.
→RAD	→ g RAD	FLOAT, H.MS	Works like →DEG, but converts to radians.
→REC	f ▶R	FLOAT	Assumes **X** and **Y** containing the coordinates r and ϑ and converts them to x and y.
%	g %	FLOAT	
%T	h X.FCN h % T	FLOAT	Calculates $\frac{x}{y}\cdot 100$.
%Σ	h STAT h % Σ	FLOAT	Calculates $\frac{x}{\sum x}\cdot 100$.
%+	h %+	FLOAT	Adds a markup of ***x*** % to ***y***.
%–	h %–	FLOAT	Subtracts a discount of ***x*** % from ***y***.
√‾	f √x	\α	
∞?	h P.FCN ∞?	PRG	Asks for infinity.
			Pure input commands:
0 … 9	0 … 9 ,	\α, integer modes depending on base setting	Numeric input. The 6 top left keys on the keyboard will be used for input of hexadecimal numbers >10 in HEXM by default. For bases <16, their defaults are switched as applicable. For bases <10, the default primary functions of some numeric keys may be blocked.
A … F	A …F (dark red print on keyboard)	-1, -2, -3, -4, -5, h	
A … Z	A …Z (dark red print on keyboard)	α	Alphabetic input. See page 3 for more information.
EEX	E (the key)	FLOAT	
[ ] or [/]	.	/c	First . is taken as a space, second as a fraction mark, e.g. 2 . 3 . 4 results in 2 ¾ in the dot matrix display.

Name in listings	Keys to press	Works in modes	Remarks
[.] or [,]	,	FLOAT	Inserts the radix mark as selected.
		α	Inserts a comma.
	h ./,	α	Inserts a point.
[.]	,	Y.MD, D.MY, M.DY	Separates the leading unit in date modes. It is left to the user to decide if a number displayed represents a date or not.
[°]	,	H.MS	Separates degrees (or hours) from minutes and seconds, so input format is HH,MMSS.
			Catalogues (non programmable): calling any catalogue will set alpha mode to allow for keying in the first 2 characters of the item wanted. In general, ▲ and ▼ browse the catalogue, and EXIT will leave it without executing anything. See next paragraphs for their contents.
CONST	RCL C	FLOAT	Calls the catalogue of constants like in HP35s. See the list of constants stored in a separate table below. ENTER↑ recalls the constant selected into **X**.
	CPX RCL C	FLOAT	Works as above, but clears **Y** in recalling.
CONV	h CONV	FLOAT	Calls the catalogue of conversions. The conversions stored are listed in a separate table below. ENTER↑ converts ***x*** according to the conversion selected.
P.FCN	h P.FCN	\α	Calls the catalogue of extra programming functions. ENTER↑ executes the function selected.
STAT	h STAT	FLOAT	Calls the catalogue of extra statistical functions. Works like P.FCN.
X.FCN	h X.FCN	FLOAT	Calls the catalogue of extra real functions. Works like P.FCN.
		Integer	Calls the catalogue of extra integer functions. Works like P.FCN.
		α	Calls the catalogue of extra alpha functions. Works like P.FCN.
	CPX h X.FCN	FLOAT	Calls the catalogue of extra complex functions. Works like P.FCN otherwise.

Name in listings	Keys to press	Works in modes	Remarks
			Pure navigation, mode switching and information commands (all non programmable):
	←	All	Deletes last digit or character put in, if input is pending.
DEL	←	PRG	Deletes current step if no input is pending.
EXIT	EXIT	All	Exits catalogues and other operations with pending input, canceling the execution of this operation.
	g OFF	All	
	ON	Calc. off	
PRGOFF	h P/R	PRG	Toggle programming mode.
PRGON	h P/R	\PRG, \α	
SHOW	h SHOW	FLOAT, \PRG	Shows the full mantissa.
		PRG	Displays a CRC-32 checksum of program memory's contents (8 hex digits), allowing to validate program integrity.
STATUS	h STATUS	All	Shows the status of all flags, similar to STATUS on HP-16C. See the paragraph about display above.
	f ◀ / g ▶	Integer	Shift the display window like in HP-16C. Useful for numbers with small bases.
	▲ / ▼	Status open	Go to previous / next set of flags.
		Catalogue open	Go to previous / next item in this catalogue.
		α	Move the cursor 1 character to the left / right in alpha register. Shifts the display window if necessary.
		PRG	Like BST / SST in HP-42S.
		\PRG, \α	
	f ↑	α	Toggles upper and lower case.
→BIN	→ f 2	\α	Shows ***x*** in target representation until the next command is executed. Mode is kept constant.
→DEC	→ f 10		
→HEX	→ g 16		
→OCT	→ g 8		

CATALOGUE CONTENTS

Here the contents of the catalogues X.FCN, P.FCN and STAT are listed. A single operation, e.g. BASE, may be contained in more than one catalogue. The characters necessary to get to a specific function in the catalogue are printed bold in this table – each red character must be replaced by a ▼ – if even the last letter of a function name is red, one may need more strokes of ▼ to access this function. The catalogues CONST and CONV are found in two paragraphs below.

TABLE OF CONSTANTS

This lists all constants contained in the catalogue CONST. Names printed in a golden field represent fundamental or measured constants, while the other ones may be derived from them. The constants π and **e** are also found on the keyboard directly. The characters necessary to get to a specific function in the catalogue are printed bold in this index – each red character must be replaced by a ▼ .

Name	Value	Dimension	Remarks
a	365,2425	d	Gregorian year (per definition)
a_0	5,291772083E-11	m	Bohr radius $= \alpha / 4\pi R_\infty$
atm	101325	Pa/atm	Standard pressure p_0
c	299792458	m/s	Vacuum speed of light (per definition)
c_1	374177107E-16	$m^2 \cdot W$	First radiation constant $= 2\pi \cdot h \cdot c^2$
c_2	0,014387752	$m \cdot K$	Second radiation constant $= hc/k$
e	2, 718281828459045	1	
eV	1,602176462E-19	J = V A s	= Electron charge x 1V
F	96485,3415	$\frac{A \cdot s}{mol}$	Faraday's constant = e N_A
g	9,80665	m/s^2	Standard earth acceleration
G	6,6742867E-11	$\frac{m^3}{kg \cdot s^2}$	Newton's gravitation constant
g_e	2,002319304362	1	Landé's g-factor
G_o	7,748091696E-5	$1/\Omega$	Conductance quantum $= 2e^2/h$
h	6,62606876E-34	J s	Planck constant
$\hbar$	1,054571596E-34	J s	$= h/2\pi$
k	1,3806503E-23	J/K	Boltzmann constant $= R/N_A$
m_e	9,10938188E-31	kg	Electron mass
m_n	1,67492716E-27		Neutron mass

Name	Value	Dimension	Remarks
m_p	1,67262158E-27		Proton mass
m_u	1,66053873E-27		Atomic unit mass = 1g / N_A
m_μ	1,88353109E-28		Myon mass
N_A	6,02214199E23	$1/mol$	Avogadro's number
R	8,314472	$\frac{J}{mol \cdot K}$	Molar gas constant
r_e	2,817940285E-15	m	Classical electron radius $= \alpha^2 \cdot a_0$
R_K	25812,80756	Ω	Von Klitzing constant $= h/e^2$
R_∞	10973731,5685	$1/m$	Rydberg constant $= \frac{\alpha^2 m_e c}{2h}$
T_o	273,15	K	= 0°C, standard temperature (per definition)
V_m	0,022413996	m^3/mol	Molar volume of ideal gas at standard conditions $= RT_0/p_0$
Z_o	376,730313461	Ω	Characteristic impedance of vacuum $= \sqrt{\mu_0/\varepsilon_0} = \mu_0 c$
α	7,297352533E-3	1	Fine-structure constant $= \frac{e^2}{4\pi\varepsilon_0\hbar c}$
γ_{EM}	0,5772156649015328606	1	Euler-Mascheroni constant
γ_p	267522212	$\frac{1}{s \cdot T}$	Proton gyromagnetic ratio $= 2\mu_P/\hbar$
ε_o	8,854187817E-12	$\frac{A \cdot s}{V \cdot m}$	Electric constant, vacuum permittivity $= 1/\mu_0 c^2$
λ_c	2,426310215E-12	m	Compton wavelength of electron $= h/m_e c$
λ_{cn}	1,319590898E-15		Compton wavelength of neutron $= h/m_n c$
λ_{cp}	1,321409847E-15		Compton wavelength of proton $= h/m_p c$

Name	Value	Dimension	Remarks
μ_B	9,27400899E-24	J/T	Bohr's magneton $= e\hbar/2m_e$
μ_e	-9,28476362E-24		Electron magnetic moment
μ_u	5,05078317E-27		Nuclear magneton $= e\hbar/2m_p$
μ_n	-9,662364E-27		Neutron magnetic moment
μ_p	1,410606633E-26		Proton magnetic moment
μ_o	1,2566370614E-6	N/A^2	Magnetic constant, vacuum permeability $= 4\pi \cdot 10^{-7}$ (per definition)
μ_μ	-4,49044813E-26	J/T	Müon magnetic moment
π	3, 141592653589793	1	
σ_B	5,6704E-8	$\frac{W}{m^2 \cdot K^4}$	Stefan Boltzmann constant $= \frac{2\pi^5 k^4}{15h^3c^2}$
Φ	1,6180339887498948482	1	Golden ratio $= \frac{1+\sqrt{5}}{2}$
Φ_o	2,067833636E-15	V s	Magnetic flux quantum $= h/2e$
∞		1	Infinity

TABLE OF CONVERSIONS

These are the conversions contained in the new catalogue CONV. The characters necessary to get to a specific conversion in the catalogue are printed bold in this index – each red character must be replaced by a ▼ . The constants **atm** and **T_o** may be useful for conversions, too – they are found in the catalogue CONST.

Conversion	Remarks	Class
acres→ha	Remember 1 ha = 10^4 m²	Area
au→km	Astronomic units	Length
Btu→J		Energy
cm→inch		Length
feet→m		Length
flozUK→ml	Remember 1 m³ = 10^3 l	Volume
flozUS→ml		Volume

Conversion	Remarks	Class
g→oz		Mass
galUK→l		Volume
galUS→l		Volume
ha→acres		Area
inch→cm		Length
J→Btu		Energy
kg→lbm		Mass
km→au		Length
km→ly	Light years	Length
km→**m**i		Length
km→**nm**i	Nautical miles	Length
l→galUK		Volume
l→galUS		Volume
lbf→N		Force
lbm→kg		Mass
ly→km		Length
m→feet		Length
mi→km		Length
ml→flozUK		Volume
ml→flozUS		Volume
N→lbf		Force
nmi→km		Length
oz→g		Mass
°C→°F		Temperature
°F→°C		Temperature

Edition	Date	Release notes
1	9.12.08	Start
1.1	15.12.08	Added the table of indicators; added NAND, NOR, XNOR, RCLWS, STOWS, //, N, SERR, SIGMA, < and >; deleted HR, INPUT, 2 flag commands, and 2 conversions; extended explanations for addressing and COMPLEX & …; put XOR on the keyboard; corrected errors.
1.2	4.1.09	Added ASRN, CBC?, CBS?, CCB, SCB, FLOAT, MIRROR, SLN, SRN, >BIN, >DEC, >HEX, >OCT, BETA, D>R, DATE, DDAYS, D.MY, M.DY, Y.MD, CEIL, FLOOR, DSZ, ISZ, D>R, R>D, EMGAM, GSB, LNBETA, LNGAMMA, MAX, MIN, NOP, REAL, RJ, W and WINV, ZETA, %+ and %-; renamed the top left keys B, C, and D, and bottom left EXIT.
1.3	17.1.09	Added AIP, ALENG, ARCL, AROT, ASHF, ASTO, ATOX, XTOA, AVIEW, CLA, PROMPT (all taken from 42S), CAPP, FC?C, FS?C, SGMNT, and the …# commands; renamed NBITS to BITS and STOWS to WSIZE; specified the bit commands closer; deleted the 4 carry bit operations.
1.4	10.2.09	Added CONST and a table of constants provided, D>J and J>D, LEAP?, %T, RCL and STO ▲ and ▼, and 2 forgotten statistics registers; deleted CHS, EMGAM, GSB, REAL and ZETA; purged and renamed the bit operations; renamed many commands.
1.5	5.3.09	Added RNDINT, CONV and its table, a memory table, the description of XEQ B, C, D to the operation index, and a and g_e to the table of constants; put CLSTK on a key, moved CLΣ and FILL, changed the % and log labels on the keyboard, put CLALL in X.FCN; checked and cleaned alpha mode keyboard and added a temporary alpha keyboard; rearranged the alphabet to put Greek after Latin, symbols after Greek consistently; separated the input and non programmable commands; cleaned the addressing tables.
1.6	12.8.09	Added BASE, DAYS+, DROP, DROPY, E3OFF, E3ON, FC?F, FC?S, FIB, FS?F, FS?S, GCD, LCM, SETDAT, SETTIM, SET24, SINC, TIME, VERS, αDAY, αMONTH, αRC#; %Σ, as well as F-, t-, and χ^2-distributions and their inverses; reassigned DATE, modified DENMAX, FLOAT, αROT, and αSHIFT; deleted BASE arithmetic, BIN, DEC, HEX, and OCT; updated the alpha keyboards; added flags in the memory table; included indirect addressing for comparisons; added a paragraph about the display; updated the table of indicators; corrected errors.
1.7	9.9.09	Added P.FCN and STAT catalogues, 4 more conversions, 3 more flags, Greek character access, CLFLAG, DECOMP, DENANY, DENFAC, DENFIX, Iβ, IΓ, αDATE, αRL, αRR, αSL, αSR, αTIME, 12h, 24h, fraction mode limits, normal distribution and its inverse for arbitrary μ and σ, and Boolean operations working within FLOAT; deleted αROT and αSHIFT, the timer, and forced radians after inverse hyperbolics; renamed WINV to W^{-1}, and beta and gamma commands to Greek; added tables of catalogue contents; modified label addressing; relabeled PRGM to P/R and PAUSE to PSE; swapped SHOW and PSE as well as Δ% and % on the keyboard; relabeled Q; corrected CEIL and FLOOR; updated X.FCN and alpha commands; updated the virtual alpha keyboard.
