WELCOME

Dear user, you hold in your hands the result of careful customizing. Mechanics and hardware of your WP 34S are of the new *HP-30b Business Professional* as is: so you get its unexcelled processor speed and also the famous rotate-and-click keys with tactile feedback as known and appreciated in vintage Hewlett-Packard calculators for decades. On the other hand, firmware and user interface of the WP 34S are newly designed and written from scratch to give you a **fast and compact <u>scientific</u> calculator like you have never had before**.

Its function set is based on the one of the renowned *HP-42S RPN Scientific*, the most powerful RPN calculator built so far ¹. We extended this set, incorporating completely the functionality of the famous programmer's calculator *HP-16C*, the fraction mode of the *HP-32SII*, probability distributions as featured by the *HP-21S*, and even **more functions for mathematics, statistics, physics, engineering, programming etc.** like

- Euler's Beta function, Fibonacci number calculation, Lambert's W (all these in real and complex domain), incomplete regularized Beta and Gamma, testing for prime numbers,
- + the error function as well as many statistical distributions and their inverses like Poisson, binomial, geometric as well as exponential, Weibull for reliability analysis, and Gaussian with arbitrary mean and standard deviation,
- + programmable sums and products,
- + extended date and time calculations based on a real time clock,
- + financial operations like mean rate of return or margin calculations,
- nearly 50 fundamental physical constants as precise as known today by standards institutes like NIST,
- + over 70 conversions, mainly between universal SI and old Imperial units,
- + complete Greek and extended Latin letter fonts covering many languages (upper and lower case in two font sizes each).

The WP 34S is the first RPN calculator overcoming the limits of a 4-level stack – forget worries about stack overflow in calculations. It features a choice of two stack sizes expanded by a complex LASTx register: traditional 4 stack levels for HP compatibility, 8 levels for convenient calculations in complex domain, for more advanced real formulas, or for whatever application you have in your mind. You get a full command set for navigation in either size. Furthermore, the WP 34S features over 100 general purpose registers, 100 user flags, 476 program steps, 3 programmable hot-keys for your favourite programs, and a 31 byte alpha register for message generation.

If you know how to deal with a good old HP RPN calculator, you can start with your WP 34S right away. To show you its features completely, however, we wrote this little

_

¹ Though the *HP-42S* was sold in 1988 already, this statement holds still. – Due to display restrictions, matrix math cannot be supported by the WP 34S. Sorry for this.

manual. It starts with a survey of the active keyboard in various modes, so you know where to find what you are looking for. It continues with tables about addressing, browsing the catalogs, and a paragraph about the display and indicators used to tell you what's going on. The major part of this booklet is taken by the index of operations, catalog contents, constants and conversions featured. It closes with a list of messages the WP 34S will display if special input conditions prevent it from executing your command as expected.

Your WP 34S is the result of an intercontinental collaboration of two individuals, an Australian and a German, though we did this in our free time, so you may call it our hobby to some extent. We baptized it 34S in honour of one of the most powerful LED pocket calculators, the *HP-34C*, and since it is our humble approach – with the hardware given – to a future 43S we can only dream of so far becoming the successor of the *HP-42S*.

We have checked everything we could think of carefully to our best knowledge, so our hope may be justified the WP 34S is bug-free. We cannot guarantee this, however, nor can we bear any liability for errors in calculations nor their possible consequences. Nevertheless, we promise we will improve the WP 34S whenever it will turn out being necessary – so if you ever discover any strange result, please report it to us, and if it is unveiled being an internal error we will provide you with an update as soon as we have one.

Enjoy!

Paul Dale and Walter Bonin

PRINT CONVENTIONS

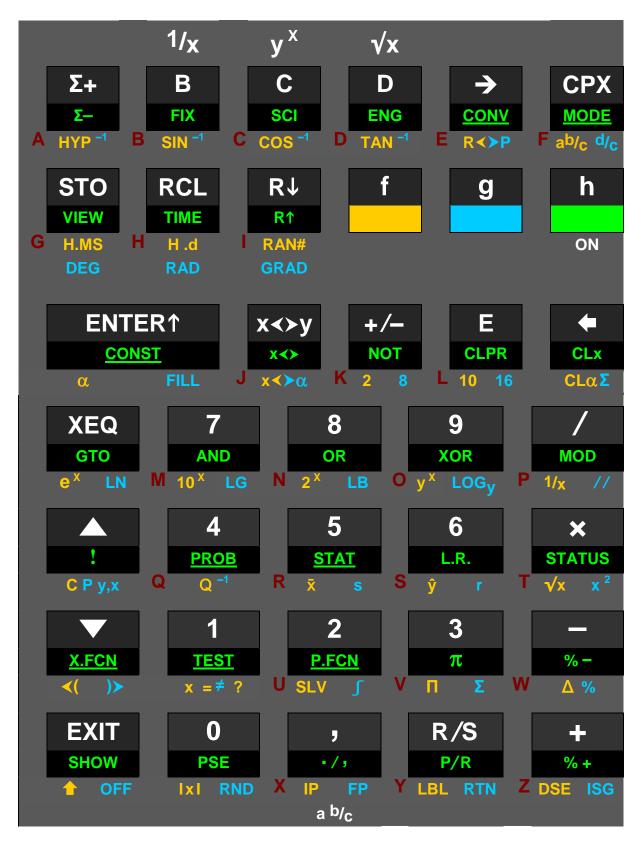

Throughout this manual, commands are generally called by their names, usually written in CAPITALS.

This **CPX** font is taken for explicit references to keys.

Register addresses are printed using Times New Roman. Lower case italic letters of this font are taken for register contents (e.g. y or r45 or alpha for contents of stack level Y or general purpose register R45 or the alpha register, respectively). Lower case bold italic Arial letters like n are used for variables.

All this holds unless stated otherwise explicitly.

KEYBOARD

Generally, white labels execute the *default primary function* of the respective key. To access a golden, blue, or green label, use *prefix* , g, or h, respectively. Any label underlined opens a *catalog*. For example, (RCL) preceded by

- fl will set calculator mode to floating point decimal numbers via .d,
- g will set angular mode to radians via RAD,
- h will recall the time of day via TIME.
- The dark red letter **H** will become relevant in alpha mode (see below).

Further remarks:

- The *hotkeys* **B**, **C**, and **D** in top row directly call the user programs carrying these labels if defined, else they act as $\sqrt[1]{x}$, $\sqrt[y]{x}$, or $\sqrt[x]{x}$, respectively.
- Prefix → combined with H.MS, H.d, DEG, RAD, GRAD, 2, 8, 10, and
 16 converts x, while R → P converts polar and rectangular coordinates in both x and y. So the latter switches representations of complex numbers, too.
- Prefix $\overline{\textbf{CPX}}$ may be used for calling functions in complex domain. Then names will be merged, e.g. $\overline{\textbf{CPX}}$ \bigcirc \bigcirc \bigcirc \bigcirc \bigcirc will be displayed as $^{\text{C}}$ COS. Generally, if an arbitrary real function \mathbf{f} works with \mathbf{x} only, its complex sibling $^{\text{C}}\mathbf{f}$ will work with $\mathbf{x}_c = \mathbf{x} + i\,\mathbf{y}$. If \mathbf{f} operates on one register, e.g. $\mathbf{R12}$, then $^{\text{C}}\mathbf{f}$ will operate on $\mathbf{R12}$ and $\mathbf{R13}$. If \mathbf{f} uses \mathbf{x} and \mathbf{y} then $^{\text{C}}\mathbf{f}$ will use $\mathbf{x}, \mathbf{y}, \mathbf{z}$ and \mathbf{t} . Please note all complex functions work with rectangular coordinates exclusively.
- Most one-number real functions replace x by the result $\mathbf{f}(x)$ stored in \mathbf{X} again. In analogy, respective complex functions replace x by the real part and y by the imaginary part of the complex result ${}^{\mathbf{C}}\mathbf{f}(x_c)$. Higher stack levels remain unchanged. Such functions are ${}^{\mathbf{C}}\mathbf{1}/x$, ${}^{\mathbf{C}}\mathbf{ABS}$, ${}^{\mathbf{C}}\mathbf{FIB}$, ${}^{\mathbf{C}}\mathbf{FP}$, ${}^{\mathbf{C}}\mathbf{IP}$, ${}^{\mathbf{C}}\mathbf{ROUND}$, ${}^{\mathbf{C}}\mathbf{SIGN}$, ${}^{\mathbf{C}}\mathbf{W}$, ${}^{\mathbf{C}}\mathbf{W}^{-1}$, ${}^{\mathbf{C}}\mathbf{x}^{\mathbf{I}}$, ${}^{\mathbf{C}}\mathbf{x}^{\mathbf{$
 - Some real functions, e.g. DECOMP, operate on one number but return two. Other operations do not consume any stack input at all but return one or two numbers, like RCL or SUM. Then the extra number(s) will be pushed on the stack, taking one level per real or two per complex number, respectively.
- Two-number real functions replace x by the result f(x, y). Level Y is filled with the content of the next higher level, i.e. z. This goes on for higher levels, only the number on top is repeated as shown \underline{below} .
 - In analogy, respective complex functions replace x by the real part and y by the imaginary part of the complex result ${}^{C}f(x_{o}, y_{c})$. The next stack levels are filled with the contents of higher levels, and the complex number in the top two levels is repeated as shown <u>below</u>. Such complex functions are ${}^{C}LOGy$, ${}^{C}y^{x}$, ${}^{C}\beta(x,y)$, ${}^{C}//$, and the basic arithmetic operations.
- There are two three-number real functions included Iβ and %MRR replacing x by the result f(x, y, z). Then Y is filled with t and so on, and the content of the top level is repeated twice. No such complex functions are featured.
- If , is used twice in input, the WP 34S enters fraction mode. Calculator modes in general are as described in the <u>separate paragraph</u> below.

Please see the <u>index of operations</u> for a complete list of all the operations provided.

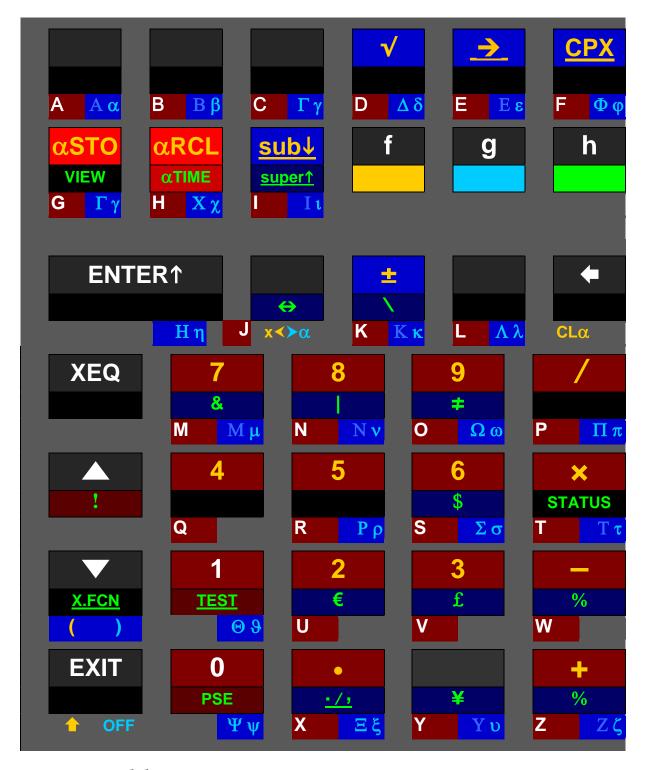

Virtual active keyboard in **hexadecimal mode**:

Primary functions of the top six keys will be numeric input, so their default primary functions are accessed using \bigcirc . The key \bigcirc is exclusively for addressing and temporary display in other bases (see <u>addressing tables</u> and <u>index of operations</u> below).

For smaller integer bases, the active keyboard will look alike, but those top keys not needed for numeric input there will keep their default primary functions, except Σ + and CPX. Attempts to enter an illegal digit will throw an <u>error</u>.

Virtual active keyboard in alpha mode:

In this mode, *alpha* is displayed in the dot matrix, and the numeric line is accessible by commands only. All labels printed on dark red or blue background in this picture append characters to *alpha* immediately or via alpha catalogs; those on blue deviate from the prints on the WP 34S at these locations.

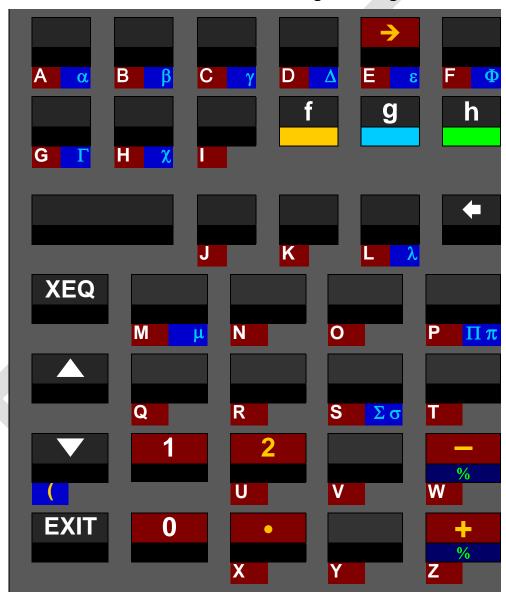

Alpha mode starts with upper case, then toggles upper and lower case. PSE appends a space. Primary function of most keys is appending the letter printed bottom

left of this key – dark red on the key plate. Then 1 is used for reaching the key tops in alpha mode there, and 2 leads to homonymic Greek letters where applicable 2.

Some logic symbols are accessible via the Boolean operations. Four currency symbols are located next to the %-sign as follows: \$ at the letter S, \$ at U for Euro, \$ at π , and \$ at Y for Y or Y or Y or Y at Y for Y and Y at Y for Y or Y and Y at Y for Y or Y and Y at Y feature even more characters (see Y below).

If *alpha* is going to exceed 31 characters, the leftmost character(s) will be discarded. See the *index of operations* for α STO and α RCL and many more alpha operations.

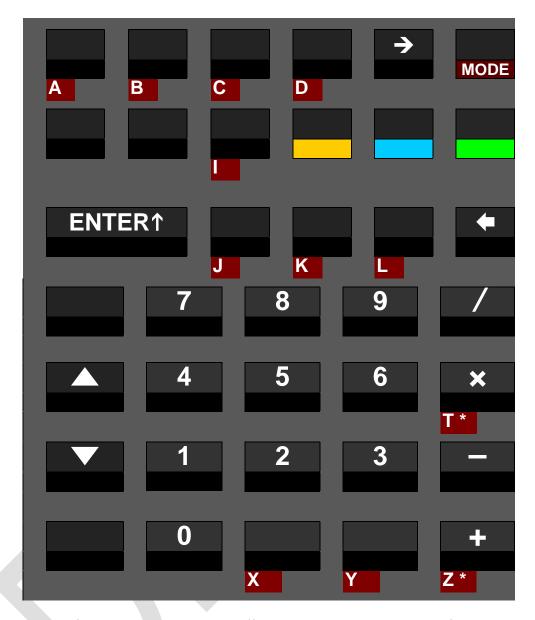

A subset of these characters is sufficient for **catalog browsing**:

² "Homonymic" according to ancient Greek pronunciation. Three letters require special handling: **Psi** is accessed via **g 0** (below **PSE**), **Theta** via **g 1** (below **TEST**), and **Eta** via **g ENTER1**. **Omicron** is not featured since looking exactly like **0** in either case. And we assigned **Gamma** also to **C** due to the alphabet, and **Chi** to **H** since this letter is next in pronunciation. Where we printed Greek capitals with lower contrast on page 7, they look like the respective Latin letters in our fonts. Greek professors, we hope for your understanding.

34S Owner's Manual Edition 1.13 Page 8 of 58

A <u>temporary alpha</u> mode is entered during input processing in comparisons and addressing. See the respective virtual active keyboard here:

This mode is left automatically when sufficient characters are put in for the respective command. Find more about it <u>below</u>.

MEMORY

	Stack registers	Ge
	D *	
	C *	
	B *	
	A *	
	T	
Alpha (31 bytes)	Z	
	Y	
Display	X	
	L	I **

As the first calculator ever, the WP 34S offers a choice of 4 or 8 stack levels. So either **T** or **D** will be the top level. Registers **A** - **D** will be allocated as stack registers if required.

Please see <u>below</u> for top level repetition and stack contents in complex calculations. While register L takes the real part of the last argument, I takes the imaginary part when a complex function was executed (see LASTx).

After using Σ +, general purpose registers R87 - R99 will contain statistical sums as indicated. J and K may be taken for parameters of statistical distributions.

Unless required for the purposes mentioned above, the registers A - D, I, J, and K are available as additional general purpose registers.

System flags **B** and **C** are handled like in the *HP-16C*. Flag **D** is set if legal results include "NaN" and "infinite".

	J ***					J = R110
	K ***					K = R111

34S Owner's Manual Edition 1.13 Page 10 of 58

STACK MECHANICS

What happens with the contents of particular stack levels depends on the function executed, its domain (integer/real or complex) and the stack size chosen.

Real functions in a 4-level stack work as known for decades. Everything works alike in a larger stack on the WP 34S – just with more levels for intermediate results. Calculating formulas from inside out stays a wise strategy in either stack. With more levels, however, stack overflow will hardly ever happen, even with the most advanced formulas you compute in your life as a scientist or engineer.

Calculating with complex numbers uses 2 registers or levels for each such number as explained above and shown here:

		Assumed contents at the	Stack	conte	nts after ex	ecutin	g			.	complex f	unctions of	İ	integ	
	_	beginning:			complex st	ack re	gister	operati	ons		1	2		function number	
	Level		CENT	ER, FILL	CDROP	c _X ↔	^C x↔y, ^C R↓, ^C R↑ CLASTx			number like ^C x ²	numbers like ^C /		Before	After	
With	T	$t = \operatorname{Im}(y_c) = \operatorname{Im}(t_c)$	lm(x_c)	$Im(y_c)$					4	4		t	t	
SSIZE4:	Z	$z = \text{Re}(y_c) = \text{Re}(t_c)$	Re(x_c)	$Re(y_c)$	x_c	x_c x_c			$y_c = t_c$	$y_c = t_c$		z	t	
	Y	$y = \operatorname{Im}(x_c)$	lm(x_c)			y_c $lastx_c$		lastv		Im($(x_c)^2$)	$Im(y_c/x_c)$		у	z
	X	$x = \text{Re}(x_c)$	Re(x_c)	$Re(y_c)$	y_c)		y_c last x_c			Re($(x_c)^2$)	$Re(y_c/x_c)$		x	y/x
With		$d = \operatorname{Im}(t_c)$	z_c	r	t_c	t_c	r	z_c	7		t_c	t_c		d	d
SSIZE8:	C	$c = \text{Re}(t_c)$	L _C	x_c	<i>L_C</i>		x_c	4c	z_c		<i>L</i> c	<i>L_C</i>		c	d
	В	$b = \operatorname{Im}(z_c)$.,	r	t_c	7	t_c	y_c	12		7	<i>t</i>		b	c
	A	$a = \text{Re}(z_c)$	y_c	x_c	<i>t_c</i>	z_c	<i>i</i> _c		y_c		z_c	t_c		а	b
	T	$t = \operatorname{Im}(y_c)$			_	*	7	34				-		t	a
	Z	$z = \text{Re}(y_c)$	x_c	x_c	z_c	x_c	z_c	x_c	x_c		y_c	z_c		z	t
	Y	$y = \operatorname{Im}(x_c)$	r	r	.,	.,	11	+	lastr		$(r)^2$	v _c /		y	z
	X	$x = \text{Re}(x_c)$	x_c	x_c	y_c	y_c	y_c	t_c	lastx _c	$(x_c)^2$	y_c / x_c		x	y/x	

So, an 8-level stack gives you the same flexibility in complex domain you are used to with a 4-level stack in real domain.

34S Owner's Manual Edition 1.13 Page 11 of 58

ADDRESSING AND COMPARING REAL NUMBERS

1 User input Dot matrix display		< ?), (x ≤ ?), (x ≈ ?)	, x≠?,		RCL, STO, RCLS, STOS, aRCL, aSTO, VIEW, x≥, DSE, ISG, DSZ, ISZ, FIX, SCI, ENG, DISP, BASE, CB and many more bit commands, or CF and the other flag commands OP_ (with temporary alpha mode set) e.g. RCL _ 3					
2 User input	0 or 1	Stack level or named reg. X, Y,	leaves temp. alpha mode.	opens indirect addressing.	Stack level or named register X, Y, Z,, K 5	Number of register or flag or bit(s) or decimals ⁶	opens indirect addressing.			
Dot matrix display	OP <i>n</i> e.g. x ≤ 0 ?	OP x e.g. x ≥ y ?	OP r_	OP → _	OP x e.g. SCI Z	OP <i>nn</i> e.g. SF 15	OP → _			
3 User input	Compares x with the number 0 .	Compares x with the number on stack level Y .	Register no. 0 0 9 9	Look right for more about indirect ad- dressing.	Sets scientific display with the number of decimals specified in stack level Z .	Stack level etc. X, Y, Z,, K	Register number			
Dot matrix display			OP r <i>nn</i> e.g. x ≠ r23?			OP → x e.g. VIEW →L	OP → nn e.g. STO →45			
			Compares <i>x</i> with the number stored in R23 .			Shows the content of the register where L is pointing to.	Stores x into the location where R45 is pointing to.			

⁻

34S Owner's Manual Edition 1.13 Page 12 of 58

³ For **RCL** and **STO**, any of +, −, **x**, **/**, ♠, or **v** may precede step 2, except in RCLM and STOM. See the index of operations.

⁴ You may skip this for register numbers >19.

⁵ Exceptions: RCL T, RCL x T, RCL Z, RCL+ Z require an **ENTER†** previous to **T** or **Z**, e.g. **RCL** + **ENTER† Z** for the latter. This holds for STO as well.

Register and flag numbers may be 00 ... 99, number of decimals 0 ... 11, integer bases 2 ... 16, bit numbers 0 to 63, and integer word size up to 64 bits. For numbers <10, you may key in e.g. **5 ENTER** instead of **0 5**. There are three additional flags addressed via **B**, **C**, and **D**. – Take into account some registers may be allocated to special applications.

ADDRESSING AND COMPARING COMPLEX NUMBERS

1 User inpu	ıt	CPX x=	? or x ≠ ?		CPX (RCL), (STO), or (x2)					
Dot matri	X	OP _ (with tempora	ary alpha mode set;		OP _ (with temporary alpha mode set) e.g. PRCL _ 7					
2 User inpu	0 or 1	Stack level or named register (X), (Z), (A), (C), (L), or (J)	ENTER↑ 8 leaves temp. alpha mode	opens indirect addressing.	Stack level or named register Z ⁹ , A , C , L , or J	Register number 0 0 9 8 10	opens indirect addressing.			
Dot matri display	oP <i>n</i> e.g. "x = 0 ?	OP x e.g. ° x ≠ z ?	OP r_	OP → _	OP x e.g. •RCL L	OP <i>nn</i> e.g. °STO 18	OP → _			
3 User inpu	Compares $x + i y$ with the real number 0 .	Compares $\mathbf{x} + i \mathbf{y}$ with $\mathbf{z} + i \mathbf{t}$.	Register number	Look right for more about indirect addressing.	This is ^C LASTx.	Stack level or named register X, Y,, K	Register number			
Dot matri display	x		OP r <i>nn</i> e.g. <mark>"x ≠ r²26?</mark>			OP → x e.g. •x<> →Z	OP → nn e.g. •STO →45			
			Compares $x + i y$ with $r26 + i r27$.			z is pointing to, in the contents of the next one.	Stores $x + i y$ into 2 consecutive registers, starting with the one where $\mathbf{R45}$ is pointing to.			

_

34S Owner's Manual Edition 1.13 Page 13 of 58

⁷ For \overline{RCL} and \overline{STO} , any of +, -, \overline{x} , or / may precede step 2. See the index of operations.

⁸ You may skip this keystroke for register numbers >19.

⁹ Exceptions: ^CRCL Z, ^CRCL + Z, ^CSTO Z, and ^CSTO + Z require an **ENTER†** previous to **Z**, e.g. **CPX STO + ENTER† Z** for the latter.

You may key in e.g. **8 ENTER1** instead of **0 8**. Take care of pairs, since a complex operation will always affect two registers: the one specified and the one following this. We recommend storing complex numbers with their real parts at even register numbers. – Take into account some registers may be allocated to special applications.

ADDRESSING LABELS

1 User			XEQ, G	TO, LBL, SLV, J,	T or Σ	
Dot matr displ	• · · VLII 'U'			e.g. GTO _		
2 User input		B, C, or D	ENTER↑ sets alpha mode.	opens indirect a sets temporar	2-digit numeric label	
Dot r	natrix ay	OP <i>ʻlabel</i> ' e.g. ∑ 'B'	OP '_	ОР	OP <i>nn</i> e.g. LBL 07	
3 User input		Sums up the function labeled B .	Alphanumeric label (≤ 3 characters ¹²)	Stack level or named register X, Y, Z,, K	Register number	
Dot r			<mark>OP '<i>label</i>'</mark> e.g. SLV'F1μ'	OP → x e.g. ∫ → T	<mark>OP → nn</mark> e.g. XEQ →44	
			Solves the function F1µ (with F1µ keyed in as explained in footer).	Integrates the function which's label is on stack level T .	Executes the routine which's label is in R44 .	

34S Owner's Manual

¹¹ Works with all these operations except **LBL**.

The 3rd character terminates entry and closes alpha mode – shorter labels need a closing **ENTER1**. For the example given here you just key in **2 ENTER1 CPX 1 EXIT 9 7** and you are done.

¹³ Some registers may be allocated to special applications. Please check the memory table above.

ADDRESSING CATALOG ITEMS

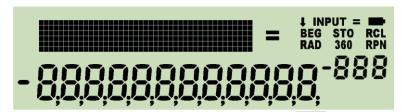

Dot matrix display (e.g. BC? in P.FCN) Alpha mode is set. 2 User input (e.g. F) Dot matrix display XEQ, ▼, ♠, EXIT, or 1st character (e.g. F) Shows 1st item starting with this character*) (e.g. FB) Shows 1st item starting with this character*) (e.g. FB))

34S Owner's Manual Edition 1.13 Page 15 of 58

DISPLAY

The display features three sections: numeric, dot matrix and fixed symbols. The numeric section features a minus sign and 12 digits for the mantissa, as well as a minus sign and 3 digits for the exponent. The dot matrix is 6 dots high and 43 dots wide, allowing for some 7 to 12 characters, depending on their widths. The fixed symbols (except the big "=") are called *annunciators*, and are for indicating modes.

The dot matrix section above is used for

- 1. indicating some more modes than the annunciators allow, adjusted to the right,
- 2. passing additional information to the user, adjusted to the left.

The numeric section in the lower part of the LCD is used for displaying numbers in different formats, status, or messages.

If two or more requests concur for display space, the items will be shown according to their priorities as follows:

- 1. error messages as described in a paragraph further below,
- 2. special information as explained below,
- 3. information about the modes the calculator is running in.

The annunciators or specific characters in the display signal the modes:

Signal	INPUT	b	d	h	0		STO					
Mode name if different	α	2			8	FLOAT	PRG					
Set by	αΟΝ	BASE2	BASE10	BASE16	BASE8	BASE0	PRGON					
Cleared by	αOFF	any	any other BASE setting, FRACT, IMPFRC, PROFRC, H.MS, TIME, →H.MS									

Signal	360	RAD	G		
Mode name if different				H.MS	FRC
Set by	DEG	RAD	GRAD	H.MS, TIME →H.MS	BASE1, FRACT IMPFRC, PROFRC 2 nd . in input
Cleared by	GRAD RAD	DEG GRAD	DEG RAD	BASE, →H COS, SIN, TAN IMPFRC, PROFRC	BASE ≠1 H.MS, TIME →H.MS

A running program is signaled by a flashing *RCL* annunciator. *RPN* may be lit permanently. Time modes (12h / 24h) are seen in the time string directly. The numeric formats of H.MS and fraction modes are unambiguous as well. Further settings are signaled in the dot matrix section, like the different date modes being indicated there by **D.MY** or **M.DY**. Defaults Y.MD and FLOAT are not indicated. Please check the examples below.

Some mode and display settings may be stored and recalled collectively by STOM and RCLM. The command RCLM recalls a 18-bit word containing mode data packed as follows, starting with the least significant bit:

Bits	Meaning	Values and corr	esponding settings	
0, 1	Display format for real numbers	0 = ALL 2 = SCI	1 = FIX 3 = ENG	
2 5	Number of decimals	0 12		
6, 7	Angular mode	0 = DEG 2 = GRAD	1 = RAD 3 = DEG H.MS	
8, 9	Date display format	0 = Y.MD	1 = D.MY $2 = M.DY$	•
10	Time display format	0 = 24h	1 = 12h	
11	Radix mark	0 = point	1 = comma	
12 14	Curve fit model	0 = LinF 2 = PowerF	1 = ExpF 3 = LogF 4 = BestF	
15, 16	Integer sign mode	0 = 2COMPL 2 = UNSIGN	1 = 1COMPL 3 = SIGNMT	
17	Stack depth	0 = 4 levels	1 = 8 levels	

So the start-up default with 4 stack levels, ALL, DEG, Y.MD, 24h, decimal point, LinF, and 2COMPL is zero.

On the other hand, settings for e.g. 8 stack levels, SCI 2, RAD, D.MY, 12h, decimal comma, BestF, UNSIGN correspond to $11010011010101010102 = 445770_{10}$.

STOM takes such a number and sets the calculator modes accordingly. Please see the <u>index of operations</u> for more information about changing modes.

Some commands and modes use the display in a special way. They are listed below in order of falling priority:

34S Owner's Manual Edition 1.13 Page 17 of 58

1. **VERS** generates a display like this:

This tells you have a WP 34S with firmware version 0.10 – the display on your own WP 34S may deviate from this example. Pressing any key will delete this message and return to previous state.

2. **STATUS** displays the status of 30 flags very concisely, allowing an immediate status overview after some training. If e.g. flags 2, 3, 5, 7, 11, 13, 14, 17, 19, and 23 are set, and labels B, C, and D are defined in program memory, STATUS will display this:

Within the numeric section, each row of horizontal bars in the mantissa shows the status of 10 flags. When a flag is set, the respective bar turns black. So here the top row of bars indicates flags 0 and 1 are clear, 2 and 3 set, and flag 4 clear. Then, the divider II separates the first group of five flags from the next. Top row bars on its right side indicate flags 5 and 7 are set. Next row of bars shows flags 11, 13, 14, 17, 19 are set, and in the lowest row only flag 23 is set. All other flags in the range from 10 to 29 are clear.

Scrolling down by will display flags 10 - 39, then 20 - 49 etc. until 80 - D. Scrolling up by reverts this. Alternatively, pressing a digit, e.g. 5, will show 30 flags starting with 10 times this digit, e.g. flags 50 - 79. The numeric exponent always indicates the status of the 3 hotkeys top left on the keyboard.

The status will be displayed until any key is pressed but \P , \triangle , or a digit < 9.

- 3. During **command input**, the dot matrix displays the command chosen until input is completed, i.e. until all required trailing parameters are entered. The prefixes [6], and [6] are shown until they are resolved. In addressing, progress is recorded as explained in the <u>addressing tables above</u> in detail.
- 4. In **programming mode**, the numeric display indicates the program step (001 476) in the mantissa and the number of free steps in the exponent, while the dot matrix shows the command contained in the respective step, e.g.:

5. For **floating point numbers**, the mantissa will be displayed adjusted to the right, the exponent to the left. Within the mantissa, either points or commas may be selected as radix marks ¹⁴, and additional marks may be chosen to separate thousands. Assume the display set to FIX 4, then 12.345678901 millions may look like:

Starting here, decimal input is written using a point as radix mark throughout this manual, although significantly less visible, unless specified otherwise explicitly. By experience, the "comma people" are more capable to read radix points and interpret them correctly than vice versa.

with thousands separators on, and without them like:

With ENG 2 and after changing the sign, the same number looks like this:

6. In **integer modes**, numbers are displayed adjusted to the left. Word size and complement setting are indicated in the dot matrix using a format WW.C, with C being 1 or 2 for 1's or 2's complement, respectively, U for unsigned, or S for sign-and-mantissa mode. Sign and 1st digit of the exponent show the base, a "c" in the 2nd digit signals a carry bit set, an "o" in the 3rd an overflow. Integer bases are indicated as follows:

Base	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
Sign and 1 st digit of exponent displayed	b	3	4	5	6	7	0	9	d	-1	-2	-3	-4	-5	h

The example shows the WP 34S in unsigned hexadecimal mode with word size 64 and carry set:

The same number displayed in binary representation will need more than 12 digits, being 1001001110100001010010110110. So, the display will show the 12 most significant digits together with an indication that there is more and where to look for it:

Press g > again to show the least significant digits:

Please note the window will also change when 12 digits are keyed in, so the right-most digits may fill the window incompletely. The digit shown in the dot matrix section

next to the arrow indicates the number of windows found in the direction shown. Each window to the left contains 12 digits always.

7. In **fraction mode**, the fraction will be shown in the numeric display, adjusted to the left. "=", "Lt", or "Gt" is indicated in the exponent if the fraction is exactly equal, slightly less, or greater than the floating point number converted, respectively.

E.g. -1.40625 will be displayed as follows:

depending on the setting for proper fractions and assuming DENMAX \geq 32. Fraction mode can handle numbers with absolute values <100,000. Maximum denominator is 9999. Some fractions featuring large numerators or denominators may exceed the display window. Then the same rules apply as in integer modes. Please note integers like 123 will be displayed as "123 0/1" or "123/1" in fraction mode, respectively.

8. In **H.MS mode**, input format is hhhh°mm'ss.dd" with the number of hours or degrees limited to 9000. Output is adjusted to the right. It may look like this:

depending on the radix setting.

9. Output of the function **DAY** will look as follows for an input of 1.13201 in M.DY mode (equivalent to inputs of 13.01201 in D.MY or 2010.0113 in Y.MD):

The display may look similar for a result of DAYS+.

10. In **alpha mode**, the alpha register is displayed in the dot matrix while the numeric section keeps the result of the last numeric operation, e.g.:

Different information may be appended to *alpha*. See the commands starting with " α " in the index of operations below. E.g. α TIME allows creating texts like

depending on the time mode setting (12h / 24h).

All keyboard inputs will be interpreted according to the modes set at input time.

FONTS

The WP 34S features a big and a small font. Both are based on Luiz Viera's fonts as distributed in 2004. Some letters were added and some modified for better legibility, since the dot matrix is only 6 pixels high. The following tables show the characters directly accessible through the keyboard. Those contained in the alpha catalogs are found <u>below</u>.

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

ABCDEFGHIJKLM NOPQRSTUVAXYZ ABCDEFGHIJKLM NOPQRSTUVAXYZ

abcdefghijklm nopqrstuvwxyz

abcdef9hijklmnoparstuvwxyz abcdefghijklmnoparstuvwxyz

ΑΒΓΔΕΖΗΘΙΚΛΜ ΝΞΟΠΡΣΤΥΦΧΨΩ

ΑΒΓΔΕΖΗΘΙΚΑΜ ΝΞΟΠΡΣΤΥΦΧΨΩ ΑΒΓΔΕΖΗΘΙΚΑΜ ΝΞΟΠΡΣΤΥΦΧΨΩ

αβγδεζηθικλμνξοπρστυφχψω **αβγδεζηθικλμυξοπρστυΦ**χψω **αβγδεζηΒικλμυξοπρστυφ**χψω

0123456789 ()+-×/±.! ↔%√\&|≠\$€£¥ 0123456789 ()+-×/±.! ≒%√\&|≠\$€£¥ 0123456789 ()+-×/±.! ≒%√\&|≠\$€£¥

INDEX OF OPERATIONS

All functions available are found below with their names and keystrokes necessary. Names printed in **bold** face therein belong to commands directly accessible on the keyboard, the others are accessible via catalogs. These names will show up in program listings as well. Sorting in index and catalogs is case insensitive and works as follows:

_, 0...9, A...Z, !,
$$\alpha$$
... ω , () + - × /±, . ? : ; " # ' * @ _ ~
→ ← ↑ ↓ ↔ < ≤ = \neq ≥ > % \$ € £ ¥ $\sqrt{ }$ ω & \ ^ | G [] { }

Super- and subscripts are handled like normal characters in sorting.

Generally, functions and keystroke programming will work as on *HP-42S*, bit and integer functions as on *HP-16C*, unless stated otherwise under remarks. Especially, all **tests** will return "Yes" or "No" in the dot matrix if called from the keyboard; if called in a program, they will skip the next program line if the test is false. Please refer to the manuals of the vintage calculators mentioned, e.g. on the DVDs distributed by *www.hpmuseum.org*.

Functions available on the WP 34S for the first time on an RPN calculator are highlighted yellow under remarks, while operations carrying a familiar name but deviating in their functionality here are marked light red.

Parameters will be taken from the lowest stack levels unless being mentioned explicitly in the 2^{nd} column. Then they must follow the command. If <u>underlined</u>, they may also be specified using indirect addressing, as shown in the <u>tables</u> above. Some parameters of statistical distributions must be given in registers **J** and **K** if specified.

Each function is listed stating the mode(s) it will work in, abbreviated by their <u>indicators</u>. In this column an "&" stands for a Boolean AND, a comma for an OR, and a backslash for "not". So e.g. 2^X works in all modes but alpha. FLOAT^H stands for "FLOAT, H.MS". All operations will also work in mode PRG unless stated otherwise explicitly.

Name	Keys to press	in modes	Remarks
c	<u>CPX</u>	FLOAT	Indicates an operation in complex domain (see <u>above</u>). CPX may be combined with the functions which's <u>names are printed in italics here</u> .
10 ^x	f 10 ^x	FLOAT	
12h	h MODE 12h	\α	Sets 12h time display mode meaning 1:23 becomes 1:23 a.m. and 13:45 becomes 1:45 p.m.
1COMPL	h MODE 1COMPL	\α	Sets 1's complement mode like in HP-16C.
1/x	f 1/x	FLOAT	
1/X	В	FLOAT	Shortcut as long as label B is not defined yet.
24h	h MODE 24h	\α	Sets 24h time display mode meaning 1:23 a.m. becomes 1:23, and 1:45 p.m. becomes 13:45.
2COMPL	h MODE 2COMPL	\α	Sets 2's complement mode like in <i>HP-16C</i> .

34S Owner's Manual Edition 1.13 Page 22 of 58

Name	Keys to press	in modes	Remarks
2 ×	f 2 ^x)	\α	
ABS	f x	\α	CABS returns $r = \sqrt{x^2 + y^2}$ in X and clears Y .
ACOS	g COS-1	FLOATH	
ACOSH	g HYP-1 COS	FLOAT	
ALL	h MODE ALL	\α	Selects the format displaying "all" digits.
		Integer	Works bitwise as in HP-16C.
AND	h AND	FLOAT	Works like AND in $HP-28S$, i.e. x and y are interpreted before executing this operation. 0 is "false", any other real number is "true".
ANGLE	h X.FCN ANGLE	FLOAT	Calculates the angle between positive x-axis and the straight line from the origin to the point (x, y) , returns this angle in X and clears Y .
ASIN	g SIN-1	FLOATH	
ASINH	g HYP-1 SIN	FLOAT	
ASR	h X.FCN ASR <u>n</u>	Integer	Works like <i>n</i> (up to 63) consecutive ASRs in <i>HP-16C</i> . ASR 0 executes as NOP.
ATAN	g TAN-1	FLOATH	
ATANH	g HYP-1 TAN	FLOAT	
BASE	h MODE BASE <u>n</u>		Sets the base for integer calculations, with
BASE10	f 10		$2 \le n \le 16$. Popular bases are directly accessible on the keyboard. Current integer base set-
BASE16	g 16	\α	ting is indicated in the exponent as explained above.
BASE2	f 2		Furthermore, BASE0 equals FLOAT, and
BASE8	g 8		BASE1 calls FRACT.
BC?	h TEST BC? <u>n</u>	Integer	Tests the specified bit in x .
BestF	h STAT BestF	FLOAT	Selects the best curve fit model, maximizing the correlation like BEST does in <i>HP-42S</i> .
BS?	h TEST BS? <u>n</u>	Integer	Tests the specified bit in x .
B(m)	h PROB B(m)	FLOAT	= BINOMDIST(x ; j ; k ; 1) in MS Excel, with the sample size j and the gross error probabili-
B ⁻¹ (p)	h PROB B ⁻¹ (p)	FLUAT	ty k . $B^{-1}(p)$ returns the number of successes g for a given probability p in X .

Name	Keys to press	in modes	Remarks
СВ	h X.FCN CB <u>n</u>	Integer	Clears the specified bit in $oldsymbol{x}$.
CEIL	h X.FCN CEIL	FLOAT	Returns the smallest integer $\geq x$.
CF	h P.FCN CF <u>n</u>	\α	Clears the flag specified.
CLFLAG	h P.FCN CLFLAG	\α	Clears all user flags.
CLREG	h X.FCN CLREG	All	Clears all general purpose registers.
CLSTK	O g FLL	No.	Clears all stock registers
CLSTK	h P.FCN CLSTK	\α	Clears all stack registers.
CLx	h CLX	\α	^c CLx clears both X and Y .
CLα	f CL a	All	Clears the alpha register like CLA in HP-42S.
CLΣ	g CLS	FLOAT	Clears all statistical sums.
СОМВ	f Cy.x	FLOAT	Returns the number of possible <u>sets</u> of y items taken x at a time. No item occurs more than once in a set, and different orders of the same x items are <u>not</u> counted separately. Formula: $C_{y,x} = \begin{pmatrix} y \\ x \end{pmatrix} = \frac{y!}{x!(y-x)!}$
CONJ	CPX X.FCN CONJ	FLOAT	Changes the sign of y.
CORR	gr	FLOAT	Returns the correlation coefficient for the current statistical data and curve fitting model.
cos	f cos	FLOATH	
COSH	f HYP COS	FLOAT	
DATE	h X.FCN DATE	FLOAT	Recalls the date from the real time clock and displays it in the numeric section in the format selected. See D.MY, M.DY, and Y.MD. The function DATE in <i>HP-12C</i> corresponds to DAYS+ here (see below).
DAY	h X.FCN DAY	FLOAT	Takes x as a date in the format selected and returns the name of the day in the dot matrix and a corresponding integer in the numeric display (Monday = 1, Sunday = 7).
DAYS+	h X.FCN DAYS+	FLOAT	Works like DATE in <i>HP-12C</i> , adding <i>x</i> days on a date in Y in the format selected and displaying the resulting date including the day of week in the same format as DAY does.

Name	Keys to press	in modes	Remarks
DBLR	h X.FCN DBLR		
DBL ×	h X.FCN DBL×	Integer	Double precision commands like in <i>HP-16C</i> .
DBL/	h X.FCN DBL/		
DECOMP	h X.FCN DECOMP	FRC	Decomposes x (after converting it into an improper fraction, if applicable), resulting in a stack [$numerator(x)$, $denominator(x)$, y , z] or [$num(x)$, $den(x)$, y , z , t , a , b , c], respectively. Reversible by division.
DEG	g DEG	FLOAT	Sets angular mode to degrees.
DENANY	h MODE DENANY	\α	Sets default fraction format like in <i>HP-35S</i> , allowing maximum precision. Any denominator up to the value set by DENMAX may appear.
DENFAC	h MODE DENFAC	\α	Sets "factors of the maximum denominator". With e.g. DENMAX = 60, possible denominators are 2, 3, 4, 5, 6, 10, 12, 15, 20, 30, and 60.
DENFIX	h MODE DENFIX	\α	Sets fixed denominator format, i.e. the denominator equaling DENMAX always.
DENMAX	h MODE DENMAX	\α	Works like /c in <i>HP-35S</i> , but maximum value settable is 9999. The maximum denominator will be set to 9999 if $x < 1$ or $x > 9999$ at execution time. For $x = 1$ the current setting is recalled.
DISP	h MODE DISP	FLOAT	Changes the number of decimals while keeping the display format (FIX, SCI, ENG) as is.
DROP	h P.FCN DROP	\α	Drops x , changing stack contents to $[y, z, t, t]$ or $[y, z, t, a, b, c, d, d]$, respectively. See <u>above</u> for ^c DROP.
DSE	f DSE <u>r</u>	DDC	Given ccccc.fffii in r , this function de-
DSZ	h P.FCN DSZ <u>r</u>	PRG	crements <i>r</i> by ii, skipping next program line if then cccccc ≤ fff for DSE, or = 0 for DSZ
D.MY	h MODE D.MY	\α	Sets the format for date display.
D→J	h X.FCN D→J	FLOAT	Takes x as a date in the format selected and converts it to a Julian day number.
D→R	h X.FCN D→R	FLOAT	Takes x as degrees and converts them to radians. Angular mode is kept.
E3OFF	h MODE E30FF	\α	Toggle the thousands separator (either a point
E3ON	h MODE E3ON	ia	or a comma depending on the radix setting).

Name	Keys to press	in modes	Remarks
ENG	h ENG <u>n</u>	\α	Sets engineering display format.
ENTER↑	ENTER+	\α	See <u>above</u> for ^c ENTER.
ERF	h STAT ERF	FLOAT	Calculates the error function $erf(x) = \frac{2}{\sqrt{\pi}} \int_{0}^{x} e^{-\tau^{2}} d\tau$
EVEN?	h TEST EVEN?	\α	Checks if x is integer and even.
e *	f e ^x	FLOAT	
ExpF	h STAT ExpF	FLOAT	Selects the exponential curve fit model.
Ex(t)	h PROB Ex(t)	FLOAT	= EXPONDIST($x; j; 1$) in MS Excel, with J containing the rate λ .
e ^x -1	h X.FCN e ^X -1	FLOAT	Returns more accurate results for the fractional part of e^X with $x \approx 0$.
Ex ⁻¹ (p)	h PROB Ex ⁻¹ (p)	FLOAT	$\mathrm{Ex}^{-1}(\mathrm{p})$ returns the survival time t_s for a given probability p in \mathbf{X} , with \mathbf{J} containing the rate λ . See Ex(t) for more.
FB	h X.FCN FB n	Integer	Inverts ("flips") the specified bit in x .
FC?			
FC?C	h TEST FC? <u>n</u>	\α	Tests the flag specified. Clears, flips, or sets
FC?F	etc.	100	this flag after testing, if applicable.
FC?S			
FF	h P.FCN FF n	\α	Flips the flag specified.
FIB	h X.FCN FIB	\α	Calculates the Fibonacci number F_x .
FILL	g FIL	\α	Copies x to all other stack levels. See <u>above</u> for $^{\mathtt{C}}FILL$.
FIX	h FIX <u>n</u>	\α	Sets fixed point display format.
FLOAT	f H.d	\α	Works like DECM in <i>HP-42S</i> . Same as BASE0.
FLOOR	h X.FCN FLOOR	FLOAT	Returns the largest integer $\leq x$.
FP	g FP	FLOAT	Returns the fractional part of x .
FP?	h TEST FP?	\α	Tests <i>x</i> for having a nonzero fractional part.
FRACT	h P.FCN FRACT	FLOAT	Sets fraction mode like in HP-35S, but display format as set by PROFRC and IMPFRC.

Name	Keys to press	in modes	Remarks
FS?			
FS?C	h TEST FS? n	No.	Tests the flag specified. Clears, flips, or sets
FS?F	etc.	\α	this flag after testing, if applicable.
FS?S			
F(x)	h PROB F(x)	FLOAT	F works like Q(F), F^{-1} like F_P in HP-21S.
F ⁻¹ (p)	h PROB F ⁻¹ (p)	TLOAT	The degrees of freedom are given in J and K .
GCD	h X.FCN GCD	\α	Returns the Greatest Common Divisor of \boldsymbol{x} and \boldsymbol{y} .
Ge(m)	h PROB Ge(m)	FLOAT	Geometric distribution: $Ge(m) = 1 - (1 - p_0)^m$ is the probability for a 1 st success after $m = x$ Bernoulli experiments. The probability p_0 for a success in each such experiment must be giv-
Ge ⁻¹ (p)	h PROB Ge ⁻¹ (p)		en in J . Ge ⁻¹ (p) returns the number of failures f before the 1 st success for a given probability p in X .
GRAD	g GRAD	FLOAT	Sets angular mode to gon or grads.
	h GTO <u>label</u>	PRG	Inserts an unconditional branch to <i>label</i> .
GTO	III (GTO) <u>label</u>	∖PRG, ∖α	Positions the program pointer to <i>label</i> .
310	h GTO	\α	Positions the program pointer to line <i>nnn</i> or to line 000, respectively (not programmable).
H.MS	f H.MS	FLOAT	Sets H.MS mode for time or angular calculations. Display is formatted as shown <u>above</u> .
H.MS+	+	H.MS	
п.IVI 3 +	h P.FCN H.MS+	FLOAT	Assumes X and Y containing times in the format hhhhomm'ss.dd", and adds or sub-
H.MS-		H.MS	tracts them, respectively. The shortcuts do not work in programming mode.
11.1913-	h P.FCN H.MS-	FLOAT	. 5
IMPFRC	g d/c	\α	Sets fraction mode allowing improper fractions in display (i.e. $5/3$ instead of 1 $2/3$). Converts x according to the settings by DEN Absolute decimal equivalents of x must be >1E-5 and <1E5. Compare PROFRC.
		FRC	Allows displaying improper fractions. Thus converts a proper fraction in X into the equivalent improper fraction, if applicable.

Name	Keys to press	in modes	Remarks
INT?	h (TEST) INT?	\α	Tests x for being an integer, i.e. having a fractional part equal to zero. Compare FP?.
IP	f P	FLOAT	Returns the integer part of x .
ISG	g [SG] <u>r</u>	PRG	Given ccccc.fffii in r , this function increments r by ii, skipping next program line if
ISZ	h P.FCN ISZ <u>r</u>	1 20	then cccccc > fff for ISG, or = 0 for ISZ.
Ιβ	h X.FCN Iβ	FLOAT	Returns the regularized incomplete beta function $\frac{\beta_x(x,y,z)}{\beta(y,z)} = \frac{1}{\beta(y,z)} \cdot \int_0^x t^{y-1} (1-t)^{z-1} dt \text{with}$ β_x being the incomplete beta function
IF	h X.FCN IF	FLOAT	Returns the regularized incomplete gamma function $\frac{\gamma(x,y)}{\Gamma(x)}$ with $\gamma(x,y) = \int_0^y t^{x-1}e^{-t}dt$ being the lower incomplete gamma function.
J→D	h X.FCN J→D	FLOAT	Takes x as a Julian day number and converts it to a date in the format selected.
LASTx	RCL L	\α	See <u>above</u> for ^C LASTx .
LBL	f LBL label	PRG	Identifies programs and routines for execution and branching. See opportunities for specifying <i>label</i> in the table <i>above</i> .
LCM	h X.FCN LCM	\α	Returns the Least Common Multiple of x and y .
LEAP?	h TEST LEAP?	FLOAT	Takes x as a date in the format selected, extracts the year, and tests for a leap year.
LinF	h STAT LinF	FLOAT	Selects the linear curve fit model.
LJ	h X.FCN LJ	Integer	
LN	g LN	FLOAT	
LN1+x	h X.FCN LN1+x	FLOAT	Natural logarithm for values close to zero. Returns $\ln(1+x)$, which provides a much higher accuracy in the fractional part of the result.
LNβ	h STAT LNβ	FLOAT	Returns the natural logarithm of $\beta(x, y)$. See
Σιτρ	h X-FCN LNβ		there.
LNΓ	h STAT LNF h X.FCN LNF	FLOAT	Returns the natural logarithm of $\Gamma(x)$. See there.

Name	Keys to press	in modes	Remarks
LOG ₁₀	g LG	FLOAT	
LOG ₂	g LB	\α	Calculates the logarithm of <i>x</i> for base 2.
LogF	h STAT LogF	FLOAT	Selects the logarithmic curve fit model.
	g LOGy	FLOAT	Calculates the logarithm of x for base y .
LOGy	CPX g LOGy	FLOAT	Calculates the logarithm of $x + iy$ for the base $z + it$.
L.R.	h L.R.	FLOAT	Calculates the parameters a1 and a0 of the fit curve through the data points accumulated, according to the model selected, and pushes them on the stack. For a straight regression line, a0 is the y-intercept and a1 the slope.
MASKL	h X.FCN MASKL <u>n</u>	Intogor	Work like MASKL and MASKR on <i>HP-16C</i> , but
MASKR	h X.FCN MASKR <u>n</u>	Integer	with the mask length following the command instead of taken from X .
MAX	h X.FCN MAX	\α	Returns the maximum of x and y .
MIN	h X.FCN MIN	\α	Returns the minimum of x and y .
MIRROR	h X.FCN MIRROR	Integer	Reflects the bit pattern in x (e.g. 000101 becomes 101000 for word size 6).
MOD	h MOD	\α	MOD of HP-42S equals RMD of HP-16C.
M.DY	h MODE M.DY	\α	Sets the format for date display.
NAND	h X.FCN NAND	\α	Works in analogy to AND.
NaN?	h TEST NaN?	\α	Tests x for "Not a Number".
nBITS	h X.FCN nBITS	Integer	Counts bits set in <i>x</i> like #B does on <i>HP-16C</i> .
NOP	h P.FCN NOP	PRG	
NOR	h X.FCN NOR	\α	Works in analogy to AND.
NOT	h NOT	\α	Works in analogy to AND.
nΣ	h STAT nΣ	FLOAT	Recalls the number of accumulated data points. Necessary for basic statistics.
N(x)	h PROB N(x)	FLOAT	= NORMDIST $(x; j; k; 1)$ in MS Excel, with the mean j and the standard deviation k .
N ⁻¹ (p)	h PROB N ⁻¹ (p)	FLOAT	= NORMINV($x; j; k$) . See N(x) for more.
ODD?	h TEST ODD?	\α	Checks if x is integer and odd.

Name	Keys to press	in modes	Remarks
OR	h OR	\α	Works in analogy to AND.
PAUSE	h PSE	PRG	Pauses program execution for about 1 s.
PERM	g Py.x	FLOAT	Returns the number of possible <u>arrangements</u> of y items taken x at a time. No item occurs more than once in an arrangement, and different orders of the same x items <u>are</u> counted separately. Formula: $P_{y,x} = x! \cdot C_{y,x}$, see COMB and FACT.
PowerF	h STAT PowerF	FLOAT	Selects the power curve fit model.
PRIME?	h (TEST) PRIME?	\α	Checks if the absolute value of the integer part of x is a prime number. Exact for $x < 66049$, Miller-Rabin with 40 iterations otherwise, with the probability P for erroneously claiming a composite is prime being $P \approx 2^{-80} \approx 10^{-24}$.
PROFRC	f ab/c	FLOAT	Sets fraction mode like in HP -35S, allowing only proper fractions or mixed numbers in display. Converts x according to the settings by DEN Absolute decimal equivalents of x must be >1E-5 and <1E5. Compare IMPFRC.
		FRC	Allows displaying only proper fractions. Thus converts an improper fraction in X , e.g. 5/3 into 1 2/3, if applicable.
PROMPT	h P.FCN PROMPT	PRG	Displays <i>alpha</i> and stops program execution (equaling α VIEW followed by STOP actually). If alpha input is requested, use the sequence α ON PROMPT α OFF. With a program running, enter the value or text requested and press R/S to continue.
P(m)	h PROB P(m)	FLOAT	= POISSON(x ; $j*k$; 1) in MS Excel, with the gross error probability j and the sample size k . Alternatively, the Poisson parameter λ may be in J if $k = 1$.
P ⁻¹ (p)	h PROB P ⁻¹ (p)	FLOAT	P^{-1} returns the number of successes g for a given probability p in X . See $P(x)$ for more.
Q(x)	f Q	FLOAT	Works like Q in HP-32E and Q(z) in HP-21S.
Q ⁻¹ (p)	g Q-1	FLOAT	Works like Q^{-1} in <i>HP-32E</i> and z_P in <i>HP-21S</i> .
RAD	g RAD	FLOAT	Sets angular mode to radians.

Name	Keys to press	in modes	Remarks
RAN#	f RAN#	FLOAT	Returns a random number between 0 and 1 like RAN in <i>HP-42S</i> .
		Integer	Returns a random bit pattern for the word size set.
RCL	RCL s	\α	See the <u>addressing table above</u> for ^C RCL.
RCLM	RCL MODE	\α	Recalls selected mode settings into X . See the paragraph about <u>indicators</u> above.
RCLS	h P.FCN RCLS s	\α	Recalls 4 or 8 values from a set of registers starting at address s , and pushes them on the stack. This is the converse command of STOS.
RCL+	RCL + s		
RCL-	RCL - s		Recalls the content of address s , executes the specified operation on it and pushes the result
RCL×	RCL X s	No.	on the stack.
RCL/	RCL / s	\α	E.g. RCL-12 recalls $r12$, subtracts x from it and displays the result. RCL \uparrow (\downarrow) recalls the
RCL↑	RCL <u>s</u>		maximum (minimum) of the values in s and X . See the <u>addressing table above</u> for ^C RCL.
RCL↓	RCL ▼ <u>s</u>		
RDX,	h ./.	FLOAT	Toggle the radix mark. Also available in P.FCN FWIW.
RDX.	.,	1 20/11	
RJ	h X.FCN RJ	Integer	Works in analogy to LJ.
RL	h X.FCN RL <u>n</u>	Integer	Works like n consecutive RLs / RLCs on HP-16C. For RL, $1 \le n \le 63$. For RLC, $1 \le n \le 63$
RLC	h X.FCN RLC <u>n</u>	intoger	64. RL 0 and RLC 0 execute as NOP.
ROUND	a PND	FLOAT	Rounds x using the current display format, like RND in $HP-42S$.
KOUND	g RND	FRC	Rounds x using the current denominator, like RND in HP -35 S .
ROUNDI	h X.FCN ROUNDI	FLOAT	Rounds <i>x</i> to next integer. ½ rounds to 1.
RR	h X.FCN RR <u>n</u>	luta e a	Works like <i>n</i> consecutive RRs / RRCs on
RRC	h X.FCN RRC <u>n</u>	Integer	HP-16C. See RL / RLC for more.

Name	Keys to press	in modes	Remarks
RTN	g RTN	\PRG	Entered from the keyboard: Moves the program pointer to the first line of the current routine. Else: Returns control to the calling routine, i.e. moves the program pointer one step behind the most recent XEQ instruction encountered. If there is none, program execution halts.
		PRG	Last command in a routine. See above.
R-CLR	h P.FCN R-CLR	FLOAT	Interprets x in the form $ss.nn$. Clears nn registers starting with number ss . E.g. for $x = 34.56$, R-CLR will clear $R34$ through $R89$.
R-COPY	h P.FCN R-COPY	FLOAT	Interprets x in the form ss.nndd. Takes nn registers starting with number ss and copies their contents to dd . E.g. for $x = 7.0345678$, $r07$, $r08$, $r09$ will be moved into R45, R46, R47, respectively.
R-SORT	h P.FCN R-SORT	FLOAT	Interprets x in the form ss.nn. Sorts the contents of nn registers starting with number ss . Assume $x = 49.026$, $r49 = 1.2$, $r50 = -3.4$; then R-SORT returns $r49 = -3.4$, $r50 = 1.2$.
R-SWAP	h P.FCN R-SWAP	FLOAT	Works like R-COPY but swaps the register contents of source and destination.
R→D	h X.FCN R→D	FLOAT	Takes x as radians and converts them to degrees. Angular mode is kept.
R↑ R↓	h Rt RJ		Rotates the stack contents one level up or down, respectively. See <u>above</u> for complex rotations.
s	gs	FLOAT	Calculates the standard deviations \mathbf{s}_y and \mathbf{s}_x and pushes them on the stack.
SB	h X.FCN SB <u>n</u>	Integer	Sets the specified bit in x .
SCI	h SCI <u>n</u>	\α	Sets scientific display format.
SEED	h STAT SEED	FLOAT	Stores a seed for random number generation.
SERR	h STAT SERR	FLOAT	Calculates the standard deviations and pushes the standard errors $\sqrt[s]{n}$ and $\sqrt[s]{n}$ on the stack.

Name	Keys to press	in modes	Remarks
SETDAT	h X.FCN SETDAT	FLOATH	Sets the date or time, respectively, for the real
SETTIM	h X.FCN SETTIM	FLOAT	time clock.
SF	h P.FCN SF <u>n</u>	\α	Sets the flag specified.
SIGN	h X.FCN SIGN	\α	Returns 1 for $x > 0$, -1 for $x < 0$, and 0 for $x = 0$ or non-numbers.
	CPX X.FCN SIGN	FLOAT	Returns the unit vector of $x + i y$ in X and Y .
SIGNMT	h MODE SIGNMT	\α	Sets sign-and-mantissa mode for integers.
SIN	f SIN	FLOATH	
SINC	h X.FCN SINC	FLOAT	Calculates $\frac{\sin(x)}{x}$.
SINH	f HYP SIN	FLOAT	
SL	h X.FCN SL <u>n</u>	Integer	Works like n (up to 63) consecutive SLs on HP-16C. SL 0 executes as NOP.
SLV	f SLV <u>label</u>	FLOAT	Solves the equation $f(x) = 0$, with $f(x)$ calculated by the routine specified. Two initial estimates of the root must be supplied in X and Y when calling SLV. For the rest, the user interface is as in $HP-15C$.
SR	h X.FCN SR <u>n</u>	Integer	Works like n consecutive SRs on <i>HP-16C</i> . SR 0 executes as NOP.
SSIZE4	h MODE SSIZE4 h MODE SSIZE8	\α	Sets the stack size to 4 or 8 levels, respectively. If stack size grows, the top level contents will be copied into the new levels. If the stack shrinks, previous top levels will be lost. – The same will happen if stack size is changed via STOM.
SSIZE?	h TEST SSIZE?	\α	Returns the number of stack levels accessible.
STO	STO d	\α	See the <u>addressing table above</u> for ^c STO.
STOM	STO MODE	\α	Sets selected modes as encoded in x . See the paragraph about <u>indicators</u> above.
STOP	R/S	PRG	Stops program execution.
STOS	h P.FCN STOS <u>d</u>	\α	Stores all stack levels in a set of 4 or 8 registers, starting at destination d .

Name	Keys to press	in modes	Remarks
STO+	STO + <u>d</u>	\α	Executes the specified operation on the content of address d and stores the result into said address.
STO-	STO — <u>d</u>		
STO×	STO X d		E.g. STO-12 subtracts x from $r12$, and stores the result in $R12$ again. STO↑ (\downarrow) takes the maximum (minimum) of the values in d and X and stores it. See the addressing table above for C STO.
STO/	STO / d		
STO↑	STO A d		
ѕто↓	STO ▼ <u>d</u>		See the <u>addressing table above</u> to STO.
SUM	h STAT SUM	FLOAT	Recalls the linear sums Σy and Σx . Useful for basic vector algebra.
TAN	f TAN	FLOATH	
TANH	f HYP TAN	FLOAT	
TIME	h TIME	FLOATH	Recalls the time from the real time clock at execution and shows it according to the mode set.
t(x)	h PROB t(x)	FLOAT	t works like $Q(t)$, t^{-1} like tp in <i>HP-21S</i> . The degree of freedom is stored in J .
t ⁻¹ (p)	h PROB t ⁻¹ (p)	TLOAT	
UNSIGN	h MODE UNSIGN	\α	Sets unsigned mode for integers.
VIEW	h VIEW s	All	Views the contents of address s .
W	h X.FCN W	FLOAT	W returns Lambert's W for given $x \ge -1/e$, while W ⁻¹ returns x for given W (≥ -1).
W ⁻¹	h X.FCN W ⁻¹		
Wb(t)	h PROB Wb(t)	FLOAT	= WEIBULL $(x; j; k; 1)$ in Excel, with the shape parameter j and the characteristic lifetime k .
Wb ⁻¹ (p)	h PROB Wb ⁻¹ (p)	FLOAT	Wb ⁻¹ returns the survival time t_s for given probability p . See Wb(t) for more.
WSIZE	h MODE WSIZE n	\α	Works like WSIZE on <i>HP-16C</i> , but with the parameter following the command instead of taken from X . WSIZE 0 sets the word size to maximum, i.e. 64 bits.
WSIZE?	h TEST WSIZE?	\α	Recalls the word size set.
x ²	g <u>x</u> ²	\α	

Name	Keys to press	in modes	Remarks
XEQ <u>label</u> B, C, or D (you may need for accessing these hotkeys in integer bases >10.)	(XEQ) <u>label</u>	PRG	Calls the respective subroutine.
		∖PRG, \α	Executes the respective program.
	PRG	Calls the respective subroutine, so e.g. XEQ C will be inserted when \bigcirc is pressed.	
	_	\PRG, \α	Executes the respective program if defined.
XNOR	h X.FCN XNOR	\α	Works in analogy to AND.
XOR	h XOR	\α	Works in analogy to AND.
x	f x	FLOAT	Pushes $\frac{1}{n}\sum y$ and $\frac{1}{n}\sum x$ on the stack.
х̄w	h STAT xw	FLOAT	Returns the weighted mean $\sum xy / \sum y$.
â	h STAT x̂	FLOAT	Returns a forecast x for a given y (in X) following the fit model chosen. See L.R. for more.
x!	h !	FLOAT	
$x \rightarrow \alpha$	g x l > a	All	Interprets x as a code of up to 6 characters. Appends these characters to $alpha$, similar to XTOA in $HP-42S$.
χ↔	h x <u>r</u>	\α	Swaps the contents of \mathbf{X} and \mathbf{r} . See <u>above</u> for complex $\mathbf{x} \leftrightarrow \mathbf{x}$.
x⇔y	xξy	\α	Swaps x and y , performing Re \leftrightarrow Im if a complex operation was executed immediately before. See <u>above</u> for $^{\text{C}}x\leftrightarrow y$.
x < ?	h TEST x < ? <u>a</u>		Compare x with a . The three dots will be replaced in the listing by a according to the examples given in the <u>addressing table above</u> . $x \approx ?$ will be true if the <u>rounded</u> values of x and
x ≤ ?	h TEST x ≤ ? <u>a</u>		
x = ?	f x = ? <u>a</u>		
x ≈ ?	h TEST x≈? <u>a</u>	\α	a are equal (see ROUND).
x ≠ ?	g <u>x ≠ ?</u> <u>a</u>		CPX f x = ? a and compare the complex
x ≥ ?	h TEST x ≥ ? <u>a</u>		number $x + iy$ as explained in the <u>addressing</u> table above.
x > ?	h TEST x > ? <u>a</u>		table dibere.

Name	Keys to press	in modes	Remarks
y ^x	f y ^x	\α	In integer modes x must be ≥ 0 .
	C	\(\alpha, -3, -4, -5, h)	Shortcut working as long as label C is not defined yet.
ŷ	f ŷ	FLOAT	Returns a forecast y (in X) for a given x following the fit model chosen. See L.R. for more.
Y.MD	h MODE Y.MD	\α	Sets the format for date display.
αDATE	h X.FCN αDATE	\integer	Takes x as a date and appends it to $alpha$ in the format set, preceded by a blank.
αDAY	h X.FCN αDAY	\integer	Takes x as a date, recalls the name of the respective day and appends its first 3 letters to $alpha$, preceded by a blank.
αΙΡ	h X.FCN αIP	All	Appends the integer part of x to $alpha$, similar to AIP in $HP-42S$.
αLENG	h X.FCN αLENG	All	Returns the number of characters found in <i>alpha</i> , like ALENG in <i>HP-42S</i> .
αΜΟΝΤΗ	h X.FCN αMONTH	\integer	Works like α DAY, but processing the month.
αOFF	h P.FCN αOFF	PRG & α	Work like AOFF and AON in HP-42S, turning
αΟΝ	h P.FCN αON	PRG & \α	alpha mode off and on.
αRCL	RCL s	α	Interprets the content of the source s as characters and appends them to <i>alpha</i> .
	h X.FCN αRCL s	\α	
αRC#	h X.FCN αRC# <u>s</u>	All	Takes the content of s as a number, converts it to a string in the format set, and appends this to <i>alpha</i> . If e.g. s = 1234 and ENG 2 and RDX. are set, then _1.23E3 will be appended.
αRL	h X.FCN αRL <u>n</u>	All	Rotates <i>alpha</i> by n characters like AROT in <i>HP-42S</i> , but with $n \ge 0$ and the parameter trailing the command instead of taken from X . $\alpha RL 0$ executes as NOP.
αRR	h X.FCN αRR <u>n</u>	All	Works like αRL but rotates to the right.
αSL	h X.FCN αSL <u>n</u>	All	Shifts the n leftmost characters out of $alpha$, like ASHF in HP - $42S$. α SL 0 equals NOP.
αSR	h X.FCN αSR <u>n</u>	All	Works like α SL but takes the \emph{n} rightmost characters instead.

Name	Keys to press	in modes	Remarks		
αSTO	1 STO <u>d</u> 1 X.FCN αSTO <u>d</u>	α \α	Stores the first (i.e. leftmost) 6 characters in the alpha register into destination d .		
	h X.FCN αTIME	FLOATH	Takes x as a time and appends it to $alpha$ in the time format selected. Compare TIME.		
αТІМЕ	h TIME	α	Recalls the time from the real time clock at execution time and appends it to <i>alpha</i> in the format selected.		
αVIEW	h X.FCN αVIEW	\α	Displays \emph{alpha} . In programs, use $\alpha VIEW$ followed by PAUSE for message output.		
$\alpha \rightarrow x$	f x∢⊳a	All	Returns the character code of the leftmost character in <i>alpha</i> and deletes this character, like ATOX in <i>HP-42S</i> .		
β(x,y)	h STAT β(x,y)	FLOAT	Returns Euler's Beta $B(x,y) = \frac{\Gamma(x) \cdot \Gamma(y)}{\Gamma(x+y)}$ with $\operatorname{Re}(x) > 0$, $\operatorname{Re}(y) > 0$. Called β here for avoiding ambiguities.		
, ()	h X.FCN β(x,y)				
Γ(x)	$\Gamma(x)$				
ΔDAYS	h X.FCN Γ(x) h X.FCN ΔDAYS	FLOAT	Assumes X and Y containing dates in the format chosen and calculates the number of days between them. Works like in <i>HP-12C</i> .		
Δ%	f \(\Delta \%	FLOAT	Calculates $100 \cdot \frac{x-y}{y}$ like %CH in <i>HP-42S</i> .		
π	hπ	FLOAT	Complex version copies π in X and clears Y .		
п	f	FLOAT	Computes a product with the routine specified by <i>label</i> . Initially, X contains the loop control number in the format <code>ccccc.fffii</code> and the product is set to 1. Each run through the routine specified computes a factor. At its end, this factor is multiplied with said product; the operation then decrements <code>cccccc</code> by <code>ii</code> and runs said routine again if <code>cccccc</code> is then <code>> fff</code> , else returns the resulting product in X .		

Name	Keys to press	in modes	Remarks			
Σ	g Σ <u>label</u>	FLOAT	Computes a sum with the routine specified by <i>label</i> . Initially, X contains the loop control number in the format ccccc.fffii and the sum is set to 0. Each run through the routine specified computes a summand; at its end, this is added to said sum; the operation then decrements cccccc by ii and runs said routine again if cccccc is then > fff, else returns the resulting sum in X .			
σ	h STAT σ	FLOAT	Works like s but calculates the standard deviation of the population instead.			
Σln ² x						
Σln²y						
Σlnx	1 2 2 2		Recall the respective statistical sums. These			
Σlnxy	h STAT Σln ² x etc.	FLOAT	sums are necessary for curve fitting models beyond pure linear. Calling them by name en-			
Σlny			hances readability of programs significantly.			
Σxlny						
Σylnx						
Σχ		FLOAT	Recall the respective statistical sums. These sums are necessary for basic statistics and lin-			
Σx ²	h STAT Σx					
Σχу	etc.		ear curve fitting. Calling them by name enhances readability of programs significantly.			
Σy			nances readability of programs significantly.			
Σy ²						
Σ+	Σ+	FLOAT				
Σ-	h Σ-					
χ²INV	h PROB χ²INV	FLOAT	χ^2 works like $Q(\chi^2)$, the inverse like χ^2_p in			
$\chi^2(x)$	h PROB $\chi^2(x)$		HP-21S. The degree of freedom is given in J.			
+	+					
-	-	\a_				
×	x	\α				
1	/					

Name	Keys to press	in modes	Remarks		
//	g ///	FLOAT	Calculates $\left(\frac{1}{x} + \frac{1}{y}\right)^{-1}$.		
+/-	+/_				
→DEG	→ g DEG	FLOAT	Takes x as an angle in the angular mode set and converts it to degrees. Angular mode is kept.		
→GRAD	→ g GRAD	FLOAT	Works like →DEG, but converts to grads.		
→ Н	→ f H.d	H.MS	Takes x as hours or degrees in the format hhhh°mm'ss.dd" and converts them into decimal numbers.		
→H.MS	→ f (H.MS)	FLOAT Takes x as decimal hours or degrees a verts them into hhhh°mm'ss.dd".			
→POL	g R∢⊳P	FLOAT	Assumes X and Y containing Cartesian coordinates (x, y) and converts them to the respective cylinder coordinates (r, ϑ) .		
→RAD	→ g RAD	FLOATH	Works like →DEG, but converts to radians.		
→REC	f R∢▶P	FLOAT	Assumes X and Y containing cylinder coordinates (r, θ) and converts them to the respective Cartesian coordinates (x, y) .		
%	g %	FLOAT	Calculates $\frac{x \cdot y}{100}$.		
%MG	h X.FCN h % MG	FLOAT	Calculates the margin 15 $100 \cdot \frac{x-y}{x}$ in % for a price x and cost y , like %MU-Price in HP -17B.		
%MRR	h X.FCN h % MRR	FLOAT	Calculates the mean rate of return in % per period, i.e. $100 \cdot \left[\left(\frac{x}{y} \right)^{\frac{1}{z}} - 1 \right]$ with $x = \text{FV} = \text{future}$ value after z periods, $y = \text{PV} = \text{present value}$. For $z = 1$, $\Delta\%$ returns the same result easier.		
%Т	h X.FCN h % T	FLOAT	Calculates $100 \cdot \frac{x}{y}$, i.e. percent of <u>t</u> otal FWIW.		
%Σ	h STAT h % Σ h X.FCN h % Σ	FLOAT	Calculates $100 \cdot \frac{x}{\sum x}$.		

Name	Keys to press	in modes	Remarks		
%+	h %+	FLOAT	Adds a markup of x % to a price y , calculating $y \cdot \left(1 + \frac{x}{100}\right)$ like in %MU-Cost of HP-17B.		
%+MG	h X.FCN h % +MG	FLOAT	Adds a margin 15 of x % to the cost y , calculating a sales price $y / \left(1 - \frac{x}{100}\right)$, as %MU-Price does in HP -17B.		
%-	h %-	FLOAT	Subtracts a discount of x % from the price y , calculating $y \cdot \left(1 - \frac{x}{100}\right)$.		
	f x				
√	D	\(\alpha, -4, -5, h)	Shortcut working as long as label D is not d fined yet.		
ı	ʃ J <u>label</u>		Integrates the function given in the routine specified. Lower and upper integration limits must be supplied in Y and X, respectively. Otherwise, the user interface is as in <i>HP-15C</i> .		
∞?	h TEST ∞?	\α	Tests <i>x</i> for infinity.		

Alphanumeric input:

Letter or digit	Keys to press	in modes	Remarks				
0	H.MS		Separates degrees (hours) from minutes and seconds, so input format is hhhh.mmssdd.				
	09	\α	Standard numeric input. For integer bases <10, input of illegal digits throws an <u>error message</u> .				
0 9		in ad- dressing	Register input. See the <u>addressing tables</u> above for more.				
	①, ①, f ②,,		Appends the respective digit to <i>alpha</i> .				
A F	A F (red print)	-1, -2, -3, -4, -5, h					

¹⁵ Margin corresponds to "Handelsspanne" in German.

34S Owner's Manual Edition 1.13 Page 40 of 58

Letter or digit	Keys to press	in modes	Remarks			
A Z	A Z (red print)	in ad- dressing	Register input. See the <u>addressing tables</u> above for the letters applicable.			
		α	Alphabetic input. See page 7 for more.			
E	E (the key)	FLOAT	Like EEX in the older vintage calculators.			
[/] or []		FRC	First , is interpreted as a space, 2 nd as a fraction mark. E.g. 2 , 3 , 4 results in 2 ³ / ₄ in the dot matrix display. Improper fractions are entered starting with a , .			
[.]	,	D.MY, M.DY, Y.MD	Separates the leading unit in date modes. The user has to take care where a number represents a date.			
		FLOAT	Inserts the radix mark as selected.			
[.] or [,]	,	α	Inserts a point.			
(or)		α	Appends a left / right parenthesis to alpha.			

Non-programmable control, clearing and information commands:

Name if existent	Keys to press	in modes	Remarks		
		Status open	Goes to previous / next set of flags.		
		Catalog open	Goes to previous / next item in this catalog.		
		α	Shifts the display window to the left / right in <i>alpha</i> if possible. Useful for longer strings.		
		Else	Acts like BST / SST in HP-42S.		
		Input pending	Deletes the last digit or character put in.		
		α	Deletes the rightmost character in alpha.		
		PRG	Deletes current step.		
		Else	Acts like CLx.		
		Integer	Shifts the display window to the left / right like in <i>HP-16C</i> . Helpful in working with small bases.		
	f 1	α	Toggles upper and lower case.		

Name if existent	Keys to press	in modes	Remarks			
	fα	\α	Toggle alpha mode for keyboard entry.			
	ENTER+	α				
	Ī	Catalog open	Leaves the catalog without executing anything.			
	EXIT	Input pending	Cancels the execution of pending operations.			
	*	Else	Acts as NOP.			
	g OFF	All	Turns calculator off.			
	ON	Calculator off	Turns calculator on.			
	h P/R	\PRG, \α PRG	Toggle programming mode for keyboard entry.			
	R/S	\PRG, \α	Entered from the keyboard: Runs the current program starting with the current step or stops the running program immediately. Compare the programmable command STOP.			
		FLOAT & \PRG	Shows the full mantissa until EXIT is released.			
	h SHOW	PRG	Displays a CRC-32 checksum of program memory contents (8 hex digits), allowing validation of program integrity.			
	XEQ	Catalog open	Selects the item displayed and exits, executing the respective command. See <u>above</u> .			
CLALL	h X.FCN CLALL	\PRG	Clears all registers and programs if confirmed.			
CLPR	h CLPR	\α	Clears the current program (i.e. the one the program pointer is in) after confirmation.			
RESET	h X.FCN RESET	All	Clears all registers and programs if confirmed, and resets all modes to start-up default, i.e. 24h, 2COMPL, ALL, DEG, DENANY, DENMAX 0, FLOAT, LinF, PROFRC, SSIZE4, WSIZE 64, Y.MD.			
STATUS	h STATUS	\PRG	Shows the status of all user flags, similar to STATUS on <i>HP-16C</i> . See <u>above</u> .			
VERS	h X.FCN VERS	\PRG	Shows the firmware version.			

Name if existent	Keys to press	in modes	Remarks
→BIN	→ f 2		These commands show x in target integer rep-
→DEC	→ f 10	l o	resentation until the key **L or *E is released, respectively. Base is kept as set.
→HEX	→ g 16	λ α	If used in integer bases 15 and 16, prefix
→oct	→ g 8		must precede the key →

Catalogs (not programmable):

Calling a catalog will set temporary alpha mode to allow for typing the first 1 or 2 characters of the item wanted.

and

browse the catalog,

XEQ selects the item displayed and exits, while

EXIT leaves the catalog without executing anything, returning to the mode as set before. See the

table above about addressing cataloged items, and the
next paragraph for detailed item lists.

Keys to press	in modes	Contents
h CONST	FLOAT	Constants like in HP35s. See them listed in a <u>table below</u> .
CPX CONST	FLOAT	This will clear Y in recalling the constant selected since they are all real.
h CONV	FLOAT	Conversions as listed in a <u>table below</u> .
f CPX	α	"Complex" letters mandatory for many languages. Upper or lower case will be displayed according to setting (see above).
h MODE	\α	Mode setting functions.
h PROB	FLOAT	Extra probability distribution functions.
h P.FCN	\α	Extra programming functions.
f RI	α	Subscripts.
h Rt	α	Superscripts.
h STAT	FLOAT	Extra statistical functions.
	\α	All tests except the two on the keyboard.
h TEST	α	Comparison symbols and brackets. Parentheses are called by and and , respectively.

Keys to press	in modes	Contents	
	FLOAT	Extra real functions.	
h X.FCN	Integer	Extra integer functions.	
	α	Extra alpha functions.	
CPX X.FCN	FLOAT	Extra complex functions.	
h ./,	α	Punctuation marks and text symbols.	
f →	α	Arrows and mathematical symbols.	

DETAILED CATALOG CONTENTS

The operations contained in the catalogs MODE, STAT, PROB, P.FCN, TEST, and X.FCN are listed in the following table. A single function, e.g. CB, may be contained in more than one catalog. The characters necessary to access a specific function in the respective catalog are printed bold in this table − ▼ has to be pressed once for each character printed red − if even the last letter of a function name is red, one may need more strokes of ▼ to access this function. See also the catalogs CONST and CONV in separate paragraphs below. The alpha catalogs are found two pages below.

		_		_		_	
MODE	STAT		PROB		P.FCN		TEST
1 2h	B estF		B(m)		CF		BC?

Here are the contents of the alpha catalogs – big font in left column or upper row, small font right or lower – making the WP 34S the most versatile global calculator known:

The letters provided here allow for correct writing Afrikaans, Català, Cebuano, Česky, Cymraeg, Deutsch, Eesti, English, Español, Euskara, Français, Gaeilge, Galego, Bahasa Indonesia, Italiano, Basa Jawa, Kiswahili, Kreyòl ayisyen, Magyar, Bahasa Melayu, Nederlands, Português, Quechua, Shqip, Slovenčina, Slovenščina, Basa Sunda, Suomeksi, Svenska, Tagalog, Winaray, Zhōngwén (with a little trick explained below), and almost Hrvatski and Srpski (sorry, no đ) as well as Dansk and Norsk (neither æ nor ø). If you know further living languages covered, please tell us.

Mandarin Chinese (Zhōngwén) features four tones, usually transcribed like e.g. mā, má, mă, and mà. So you need different letters for ā and ă here, and for e, i, o, and u, too. With 6 pixels total character height we found no way to display them in both fonts nicely, keeping letters and accents separated for easy reading. For an unambiguous solution, we suggest using a dieresis (else not employed in Hànyǔ pīnyīn) representing the third tone here.

CONSTANTS

This lists the contents of the catalog CONST. Values of physical constants (*incl. their relative standard deviations given in parentheses below*) are from CODATA 2006, copied in August 2010. Green background denotes exact or almost exact values. The more the background turns to red, the less precise the respective constant is known ¹⁶.

The characters necessary to get to a specific function in the catalog are printed bold in this index – (▼) has to be pressed once for each character printed red.

For the units, remember Tesla with $1T=1\frac{Wb}{m^2}=1\frac{V\cdot s}{m^2}$, Joule with $1J=1N\cdot m=1\frac{kg\cdot m^2}{s^2}$ and on the other hand $1J=1W\cdot s=1V\cdot A\cdot s=\frac{1}{e}eV\approx 6.24\cdot 10^6 TeV$. Thus $1\frac{J}{T}=1A\cdot m^2$.

	Numeric value	Unit	Remarks
а	365.2425	d	Gregorian year (per definition)
a ₀	5.2917720859 E -11 <i>(6.8E-10)</i>	m	Bohr radius $=\frac{\alpha}{4\pi \cdot R_{\infty}}$
С	2.99792458 E 8	m/s	Vacuum speed of light (per definition)
C ₁	3.74177118 E -16 <i>(5.0E-8)</i>	$m^2 \cdot W$	First radiation constant $= 2\pi \cdot h \cdot c^2$
C ₂	0.014387752 <i>(1.7E-6)</i>	$m \cdot K$	Second radiation constant $=\frac{hc}{k}$
е	1.602176487 E -19 <i>(2.5E-8)</i>	С	Electron charge $=\frac{2}{K_J R_K} = \Phi_0 G_0$
еE	2.718281828459045	1	Euler's e. Please note the letter e is used for the electron charge elsewhere in this table.
F	96485.3399 <i>(2.5E-8)</i>	$\frac{C}{mol}$	Faraday's constant = $e N_A$
g	9.80665	m/s^2	Standard earth acceleration (per definition)
G	6.67428 E -11 <i>(1.0E-4)</i>	$\frac{m^3}{kg \cdot s^2}$	Newton's gravitation constant
G。	7.7480917004 E -5 <i>(6.8E-10)</i>	1/Ω	Conductance quantum $=\frac{2e^2}{h}=\frac{2}{R_K}$ with the von Klitzing constant $R_K=25812.807557~\Omega$

¹⁶ The bracketed values printed here for your kind attention allow you to compute the precision of results you may obtain using these constants. The procedure to be employed is called error propagation. It is often ignored, though essential for trustworthy results – not only in science. Please turn to respective texts before you believe in 4 decimals of a calculation result based on yardstick measurements.

. .

	Numeric value	Unit	Remarks
g _e	2.0023193043622 (7.4 E -13)	1	Landé's g-factor

π	3.141592653589793	1	
σΒ	5.6704 E -8 <i>(7.0E-6)</i>	$\frac{W}{m^2K^4}$	Stefan-Boltzmann constant $=\frac{2\pi^5 k^4}{15h^3 c^2}$
Φ	1.61803398874989485	1	Golden ratio $=\frac{1+\sqrt{5}}{2}$
Фо	2.067833667 E -15 <i>(2.5E-8)</i>	Vs	Magnetic flux quantum $= \frac{h}{2e} = \frac{1}{K_J}$ with the Josephson constant $K_J = 4.83597891 \cdot 10^{14} Hz/V$
8		1	Infinity (may the Lord of Mathematics forgive us calling this a constant)

CONVERSIONS

These are the contents of the catalog CONV 17 . The characters necessary to access a specific conversion there are printed bold in this index – \blacktriangledown has to be pressed once for each character printed red. The constant T_o may be useful for conversions, too; it is found in the <u>catalog CONST</u>. The conversion factors or divisors listed in this table will not be seen when executing a conversion.

Conversion		Remarks	Class

1

For most readers, many of the units appearing here may look obsolete at least. They die hard, however, in some corners of this world. For symmetry reasons, we may also add some traditional Indian and Chinese units. Anyway, this catalog provides the means to convert local to common units.

MESSAGES

There are some commands generating messages also in the dot matrix section of the display. Four of them, DAY, DAYS+, STATUS, and VERS, were introduced above in the <u>paragraph about display</u> already. Others are PROMPT, aVIEW and many more alpha commands, and the test commands as mentioned <u>above</u>.

Furthermore, there are a number of error messages. Depending on error conditions, the following messages will be displayed:

Message	Mode(s) allowing this message	Explanation and Examples
bad date 300 RPN Error	FLOAT	Invalid date format or incorrect date in input, e.g. month >12, day >31 etc.
bad di9it ™ Error b	Integer	Invalid digit in integer input, e.g. 2 in binary, 9 in octal, or +/- in unsigned mode.
bad mode 360 RPN Error	All	Caused by calling an operation in a mode where it is not defined, e.g. SIN in hexadecimal.
		An argument exceeds the domain of the mathematical function called. May be caused by roots or
domain 300 RPN Error	\α	logs of negative numbers (if not preceded by $\overline{\textbf{CPX}}$), by 0/0, LN(0), Γ (0), TAN(90°) and equivalents, ATANH(x) for $ \text{Re}(x) \ge 1$, ACOSH(x)
		for $Re(x) < 1$, etc.
no such 300 RPN L868L	All	Attempt to address an undefined label.
out of range 360 RPN		 A number exceeds the valid range. Caused e.g. by specifying decimals >11, word size >64, negative flag numbers, integers ≥2⁶⁴, hours or degrees >9000, invalid times, denominators ≥9999 etc.
Error	All	A register address exceeds the valid range.
		 May also happen in indirect addressing. An R-operation (e.g. R-COPY) attempts exceeding valid register numbers (0 99).
SLY J X II RAD STO RPN	PRG	Nested use of solve, integrate, sum or product is not allowed.

Message	Mode(s) allowing this message	Explanation and Examples
undefined 500 RPN OP-COdE	All	An instruction with an undefined op-code occurred (should never happen, but who knows).
word size *** Łoo SMARLL **	Integer, \PRG	Stack or register content is too big for the word size set.
+w 360 RPN	\α, \PRG	Division of a number > 0 (or < 0) by zero. Divergent sum or product or integral.
-w 360 RPN	iu, irkg	Divergent sum or product or integral.Positive (or negative) overflow in FLOAT.
18 levels RAD STO RPN	PRG	Subroutine nesting exceeds 8 levels.

Any key pressed will erase the error message displayed and execute with the stack contents present.

APPENDIX A: INTERNAL SUPPORT COMMANDS

Some commands are used in internal routines exclusively and are not accessible by the user. They are listed below for sake of a complete documentation:

Name	Purpose and remarks		
BACK	Takes an argument $0 \le n \le 99$ (may be specified indirectly) and jumps n program steps backwards. Reaching step 000 stops program execution.		
iC	Internal constants, selected by the number specified: 0		
INISLV	Initializes the solver. Its arguments come from some hidden registers and it updates these.		
RTN+1	Returns control to the calling routine like RTN does, but moves the program pointer to the <u>second</u> line following the most recent XEQ instruction encountered. If there is no matching XEQ, program execution halts.		
SKIP	Takes an argument $0 \le n \le 99$ (may be specified indirectly) and skips n program steps forwards. If this skip would land beyond the end of <u>occupied</u> program memory, the effect will be the same as if a RTN had been encountered.		

34S Owner's Manual Edition 1.13 Page 56 of 58

Name	Purpose and remarks
SPEC?	Tests if x is special (NaN or infinite).
STPSLV	Solver step. Updates the internal solver state based on the last function evaluation. Returns zero if finished and non-zero (i.e. 1) if solving should stop/has converged.
USR	Calls a user subroutine (used by SLV, \int , Π and Σ). The subroutine is defined by the argument to the initial command (either numeric of alpha label)

APPENDIX B: CANDIDATES FOR FURTHER FUNCTIONS

If space allows, the following functions may be implemented easily since they are coded already. None of these are counting the catalog and function table overheads. Two bytes for a catalog entry (one for each catalog it is in) and 12-20 bytes for a function table entry (but only one of these), i.e. not terribly significant. These are all moderately useful functions.

Function name and remarks	Size	Domain
AGM = limit of arithmetic geometric mean.	528 B	\mathbb{R}
Bessel functions of first and second kinds:	4470 B	R, C
Cube / cube root	576 B	\mathbb{Z} , \mathbb{R} , \mathbb{C}
Digamma function (ψ , needed for Bessel functions of second kind of integer order)	1384 B	R, C
Fused multiply/add The real version can be replaced by complex multiply. x+y*z can be done via (y, x) * (z, -1) at a pinch.	96 B	Z, R
Jacobi elliptic functions S _n , C _n & D _n	1780 B	R, C
Riemann's Zeta function $\zeta(x) = \sum_{n=1}^{\infty} \frac{1}{n^x}$ with $\operatorname{Re}(x) > 1$.	2012 B	R, C
x!!	288 B	R, C

PRIME? also includes overflow resistant code for (a * b) mod c and (a ^ b) mod c which could also be exposed if required.

Edit.	Date	Release notes
1	9.12.08	Start
1.1	15.12.08	Added the table of indicators; added NAND, NOR, XNOR, RCLWS, STOWS, //, N, SERR, SIGMA, < and >; deleted HR, INPUT, 2 flag commands, and 2 conversions; extended explanations for addressing and COMPLEX &; put XOR on the keyboard; corrected errors.
1.2	4.1.09	Added ASRN, CBC?, CBS?, CCB, SCB, FLOAT, MIRROR, SLN, SRN, >BIN, >DEC, >HEX, >OCT, BETA, D>R, DATE, DDAYS, D.MY, M.DY, Y.MD, CEIL, FLOOR, DSZ, ISZ, D>R, R>D, EMGAM, GSB, LNBETA, LNGAMMA, MAX, MIN, NOP, REAL, RJ, W and WINV, ZETA, %+ and %-; renamed the top left keys B, C, and D, and bottom left EXIT.
1.3	17.1.09	Added AIP, ALENG, ARCL, AROT, ASHF, ASTO, ATOX, XTOA, AVIEW, CLA, PROMPT (all taken from 42S), CAPP, FC?C, FS?C, SGMNT, and the# commands; renamed NBITS to BITS and STOWS to WSIZE; specified the bit commands closer; deleted the 4 carry bit operations.
1.4	10.2.09	Added CONST and a table of constants provided, D>J and J>D, LEAP?, %T, RCL and STO ▲ and ▼, and 2 forgotten statistics registers; deleted CHS, EMGAM, GSB, REAL and ZETA; purged and renamed the bit operations; renamed many commands.
1.5	5.3.09	Added RNDINT, CONV and its table, a memory table, the description of XEQ B, C, D to the operation index, and a and g_e to the table of constants; put CLSTK on a key, moved CL Σ and FILL, changed the % and log labels on the keyboard, put CLALL in X.FCN; checked and cleaned alpha mode keyboard and added a temporary alpha keyboard; rearranged the alphabet to put Greek after Latin, symbols after Greek consistently; separated the input and non-programmable commands; cleaned the addressing tables.
1.6	12.8.09	Added BASE, DAYS+, DROP, DROPY, E3OFF, E3ON, FC?F, FC?S, FIB, FS?F, FS?S, GCD, LCM, SETDAT, SETTIM, SET24, SINC, TIME, VERS, α DAY, α MONTH, α RC#; $\%\Sigma$, as well as F-, t-, and χ^2 -distributions and their inverses; reassigned DATE, modified DENMAX, FLOAT, α ROT, and α SHIFT; deleted BASE arithmetic, BIN, DEC, HEX, and OCT; updated the alpha keyboards; added flags in the memory table; included indirect addressing for comparisons; added a paragraph about the display; updated the table of indicators; corrected errors.
1.7	9.9.09	Added P.FCN and STAT catalogs, 4 more conversions, 3 more flags, Greek character access, CLFLAG, DECOMP, DENANY, DENFAC, DENFIX, I β , I Γ , α DATE, α RL, α RR, α SL, α SR, α TIME, 12h, 24h, fraction mode limits, normal distribution and its inverse for arbitrary μ and σ , and Boolean operations working within FLOAT; deleted α ROT, α SHIFT, the timer, and forced radians after inverse hyperbolics; renamed WINV to W $^{-1}$, and beta and gamma commands to Greek; added tables of catalog contents; modified label addressing; relabeled PRGM to P/R and PAUSE to PSE; swapped SHOW and PSE as well as Δ % and % on the keyboard; relabeled Q; corrected CEIL and FLOOR; updated X.FCN and alpha commands; updated the virtual alpha keyboard.
1.8	29.10.09	Added R-CLR, R-COPY, R-SORT, R-SWAP, RCLM, STOM, alpha catalogs, 1 more constant and some more conversions, a table of error messages, as well as the binomial, Poisson, geometric, Weibull and exponential distributions and their inverses; renamed some commands; put $\sqrt{}$ instead of π on hotkey D.
1.9	14.12.09	Added two complex comparisons; swapped and changed labels in the top three rows of keys, dropped CLST; completed function descriptions in the index.
1.10	19.1.10	Added IMPFRC, PROFRC, ^C ENTER, αBEG, αEND, and an addressing table for items in catalogs; updated temporary alpha mode, display and indicators, RCLM and STOM, alpha-commands and the message table; renamed the exponential distribution; wrote the introduction.
1.11	21.9.10	Changed keyboard layout to bring Π and Σ to the front, relabeled binary log, swapped the locations of π , CLPR, and STATUS, as well as SF and FS?; created a menu TEST for the comparisons removed and the other programmable tests from P.FCN; added %MG, %+MG, %MRR, RESET, SSIZE4, SSIZE8, SSIZE7, $^{\text{C}}\text{DROP}$, $^{\text{C}}\text{FILL}$, $^{\text{C}}\text{R}\downarrow$, $^{\text{C}}\text{R}\uparrow$, registers J and K, a table of contents and tables for stack mechanics and addressing in complex operations; updated memory and real number addressing tables, DECOMP, αOFF , αON , Π , and Σ ; renamed ROUNDI, WSIZE?, $\beta(x,y)$, $\Gamma(x)$ and the constant p_0 ; deleted DROPY (use $x \leftrightarrow y$, DROP instead), αAPP , αBEG , αEND , and the "too long error" message; deleted Josephson and von Klitzing constants (they are just the inverses of other constants included in CONST already); brought more symbols on the alpha keyboard.
1.12	22.12.10	Modified keyboard layout; added catalogs MODE and PROB; changed mode word, catalog contents and handling (XEQ instead of ENTER), as well as some non-programmable info commands; expanded IMPFRC and PROFRC; added a paragraph about the fonts provided and explained alpha catalogs in detail; added PRIME? and some conversions; deleted FRACT, OFF and ON.
1.13	3,2,11	Modified keyboard layout; modified αTIME, radix setting, H.MS+ and H.MS-; added EVEN?, FP?, INT?, ODD?, RCLS, STOS, returned FRACT; added and renamed some conversions; added appendices A and B; baptized the device WP 34S.
