WP 34S Command Alias Names for the Assembler

Only commands where an alias exists or where the command name as used by the assembler, the "pretty name", differs from its normal display are listed.

Alpha Characters

Valid methods to enter an alpha character are:

```
[alpha] X
'X'
```

If X is outside the ASCII range you can use its 'Pretty Name':

```
[alpha] [degree]
'degree'
```

Note that the square brackets are not used inside single quotes, but there is an exception: If removing the brackets results in a single character, such as with `[^]`, you need to include the brackets in single quotes: `'[^]'`, otherwise the character would be confounded with a simple `'^'`.

Some national characters can be used directly, notably those in the ISO 8859-1 Latin-1 character set. This includes the German umlauts and most accented characters as used in French. In the preprocessor you can write:

```
"Allô Réné"
```

In most cases this compiles without problems. There are a few characters (the last 16 in the table below) which must not appear in the third position of a multi character command which is generated by the assembler from a string in double quotes. The assembler will tell you but the preprocessor does not know enough about the encoding to avoid this in any case. If this happens break the string in separate lines just before the illegal character.

Instead of:

```
"Glühwein"
```

You need to code:

```
"Gl"
"ühwein"
```
